TECHNICAL SERVICE BULLETIN

November 17, 2020

This technical service bulletin is to announce that The Harris Products Group has made a significant quality improvement to the Model 720 and 740 Series High Purity Specialty Gas Regulators. Customers who purchase these models configured with an outlet diaphragm valve will now receive a ¼ -Turn High Purity Diaphragm Valve rather than the standard multi-turn valve with the knob (see figures 1 and 2 below). This change represents no additional cost to our customers.

The ¼- turn diaphragm valve offers a visual color-coded Open/Close indicator so that the user automatically knows what the condition of the outlet valve is. Visual indication of the valve condition gives an added measure of safety for specialty gas and high purity gas systems. Harris is the first US Manufacturer to offer this as a standard feature for high purity regulators proving, once again, that we are leading the industry in quality, safety and innovation.

This change has already been implemented and all regulators ordered as of this publication date will receive the upgraded valves.

Please contact Technical Service at the Harris Products Group for additional information, or, if you have any questions regarding this change.
