FLEXTEC 450 MACHINE SCHEMATIC G6462-7 REV: B

SWITCHBOARD P.C. BOARD

		S29423 SWITCHBOARD
LED#	COLOR	FUNCTION
1	GREEN	+5V DC POWER SUPPLY "OK"
2	GREEN	CAN POWER SUPPLY "OK"
3	GREEN	STATUS "OK"
3	RED	STATUS "ERROR" (CHECK CODE FOR SPECIFIC ERROR)
4	GREEN	+15V DC POWER SUPPLY "OK"

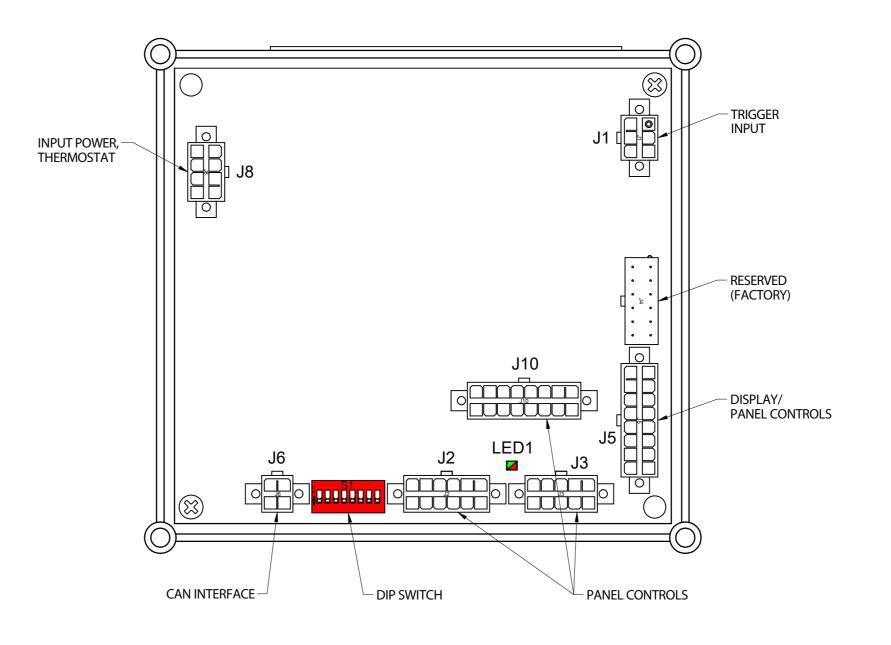

USING THE FLEXTEC 450 SWITCHBOARD STATUS LED

LIGHT CONDITION	MEANING
Steady Green	System OK.
Blinking Green	Occurs during startup or reset, and indicates that the switchboard is waiting for communication from the control board. Normal for the first 1-10 seconds after power is turned on.
Alternating Green and Red	A system fault has occurred. If the switchboard status LED is flashing any combination of red and green, errors are present.
	Individual code digits are flashed in red with a long pause between digits. If more than one code is present, the codes will be separated by a green light.
	See Page 3 for an Error Code Troubleshooting Guide.

VRD Setup

Input Voltage (3 phase, 50/60Hz)	Control Board DIP Switch Configuration
380V	S1
460V	
575V	

CONTROL P.C. BOARD

		S28454 CONTROL P.C. BOARD	
LED#	COLOR	FUNCTION	TEST MODE CONFIGURATION
1	GREEN	STATUS "OK"	TEST MODE CONFIGURATION
1	RED	STATUS "ERROR" (CHECK CODE FOR SPECIFIC ERROR)	S1

TURN ON PIN FOUR TO ENABLE TEST MODES ALL SWITCHES ARE OFF BY FACTORY DEFAULT

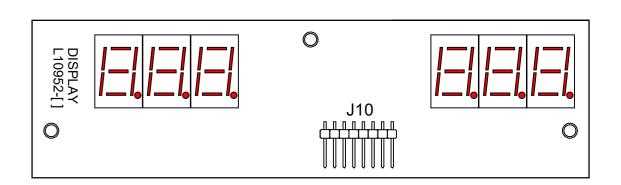

USING THE FLEXTEC 450 CONTROL BOARD STATUS LED

LIGHT CONDITION	MEANING
Steady Green	System OK.
Alternating Green and Red	A system fault has occurred. If the Control Board status LED is flashing any combination of red and green, errors are present.
	Individual code digits are flashed in red with a long pause between digits. If more than one code is present, the codes will be separated by a green light.
	See Page 3 for an Error Code Troubleshooting Guide.

PRECHARGE P.C. BOARD

DISPLAY P.C. BOARD

CONSTANT VOLTAGE TEST MODE

To enable Constant Voltage test mode:

- Set dip switch #4 to ON
- Set "WELD TERMINALS" switch to " "
- Set "MODE SELECT" knob to "GTAW" • Set "LOCAL/REMOTE" switch to "LOCAL"
- Set "ARC CONTROL" knob to "+10" Set "HOT START" switch to "OFF"
- Use the "OUTPUT CONTROL KNOB" to adjust
- the setpoint to a desired value on the right display • Use the "WELD TERMINALS" switch to

enable and disable output

CONSTANT CURRENT TEST MODE

To enable Constant Current test mode:

- Set dip switch #4 to ON
- Set "WELD TERMINALS" switch to "☐"
- Set "MODE SELECT" knob to "GTAW" • Set "LOCAL/REMOTE" switch to "LOCAL"
- Set "ARC CONTROL" knob to "-10"
- Set "HOT START" switch to "OFF" • Turn on input power.
- Use the "OUTPUT CONTROL KNOB" to adjust
- the setpoint to a desired value on the right display • Use the "WELD TERMINALS" switch to enable and disable output

ACCESS ERROR LOG

To access the Error Log:

- Set dip switch #4 to ON
- Set "WELD TERMINALS" switch to "
- Set "MODE SELECT" knob to "GTAW"
- Set "LOCAL/REMOTE" switch to "LOCAL"
- Set "OUTPUT CONTROL KNOB" to "MIN" • Set "ARC CONTROL" knob to "-10"
- Set "HOT START" switch to "ON"
- Turn on input power. The display will show
- "8.8.8" "8.8.8" and "THERMAL LED" will light • The displays will then go to "- - - " "- - -" and
- "THERMAL LED" will go out.
- Toggle the "HOT START" switch "OFF" and "ON"
- to step through menu's
- STEP E00 to E14 are error logs in chronological order
 To clear error logs set the "LOCAL/REMOTE" switch to " " then back to "LOCAL"

ERROR CODE TROUBLESHOOTING GUIDE

31	Primary Overcurrent
Description	Peak current through the transformer primary has exceeded threshold (140 amps).
•	Verify connections to the switchboard, transformer and output rectifier assemblies
Possible Solution 1	are made correctly and there are no damaged components in the machine.
Possible Solution 2	Replace defective main transformer.
Possible Solution 3	Replace defective switchboard assembly (S28443).
36	Thermal Fault
Description	Thermostat on output rectifier heat sink or embedded in transformer has tripped.
Possible Solution 1	Do not exceed allowable ambient temperature or duty cycle limits.
Possible Solution 2	Verify that fan is operating and airflow is not being blocked.
Possible Solution 3	Measure thermostats at control board and replace if defective.
-44	
711	Capacitor Fault (Over-Voltage or Under-Voltage)
Description	Input voltage is less than 160 VDC or more than 1050 VDC
Possible Solution 1	Verify input voltage level, frequency, and quality. Verify that line is not too soft.
Possible Solution 2	If problem occurs on a generator, verify proper operation when connected to municipal power lines.
Possible Solution 3	Replace defective switchboard assembly (S28443).
i oggibio odiutidii o	Tropiado adiodrivo divitoribuara addernory (UZUTTU).
712	CAN Communication Timeout
Description	CAN communication between switchboard and control board has timed out.
Possible Solution 1	Check the physical wiring and connections between control board and switchboard.
Possible Solution 2	Verify power supply to control board and switchboard.
	(-10) c. com (-10) (-10) c. com (-10) c. com (-10) c. com (-10)
713	Misconnection - Switchboard Supply Voltage too High
Description	Switchboard auxiliary supply voltage is higher than 62 VDC at machine power-up.
•	Improper input voltage configuration. Verify primary reconnect position, measure
Possible Solution 1	input voltage level and check three phase operation.
Possible Solution 2	Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC
Possible Solution 2	output at 14 pin connector to determine the source of the problem.
Possible Solution 3	Replace defective switchboard assembly (S28443).
714	Misconnection - Switchboard Supply Voltage too Low
714 Description	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up.
	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure
Description	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation.
Description	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC
Description Possible Solution 1 Possible Solution 2	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem.
Description Possible Solution 1	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC
Description Possible Solution 1 Possible Solution 2 Possible Solution 3	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443).
Description Possible Solution 1 Possible Solution 2	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem.
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply voltage momentarily drops below 20 VDC.
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply woltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Verify input voltage level, frequency, and quality. Verify that line is not too soft.
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description Possible Solution 1	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply voltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem.
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description Possible Solution 1 Possible Solution 2	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply woltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Verify input voltage level, frequency, and quality. Verify that line is not too soft.
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description Possible Solution 1 Possible Solution 2 Possible Solution 3	Switchboard auxiliary supply woltage is lower than 42 VDC at machine power-up. Improper input woltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply woltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Verify input voltage level, frequency, and quality. Verify that line is not too soft. Replace defective switchboard assembly (S28443). Control Board Misconfiguration
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description Possible Solution 1 Possible Solution 2 Possible Solution 2 Possible Solution 3	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply voltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Verify input voltage level, frequency, and quality. Verify that line is not too soft. Replace defective switchboard assembly (S28443). Control Board Misconfiguration A jumper on the control board has been placed in the incorrect position.
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description Possible Solution 1 Possible Solution 2 Possible Solution 3	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply voltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Verify input voltage level, frequency, and quality. Verify that line is not too soft. Replace defective switchboard assembly (S28443). Control Board Misconfiguration A jumper on the control board has been placed in the incorrect position. Verify that the wiring to connector J5 on the control board matches the machine
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description Possible Solution 1 Possible Solution 2 Possible Solution 3 717 Description Possible Solution 1	Switchboard auxiliary supply woltage is lower than 42 VDC at machine power-up. Improper input woltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply voltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Verify input voltage level, frequency, and quality. Verify that line is not too soft. Replace defective switchboard assembly (S28443). Control Board Misconfiguration A jumper on the control board has been placed in the incorrect position. Verify that the wiring to connector J5 on the control board matches the machine wiring diagram.
Description Possible Solution 1 Possible Solution 2 Possible Solution 3 715 Description Possible Solution 1 Possible Solution 2 Possible Solution 3 717 Description	Switchboard auxiliary supply voltage is lower than 42 VDC at machine power-up. Improper input voltage configuration. Verify primary reconnect position, measure input voltage level and check three phase operation. Damaged auxiliary transformer or intermittent "A" lead connection. Verify 42 VAC output at 14 pin connector to determine the source of the problem. Replace defective switchboard assembly (S28443). Switchboard Undervoltage Lock Out Switchboard auxiliary supply voltage momentarily drops below 20 VDC. Damaged auxiliary transformer or intermittent "A" lead connection.
