AIR CLEANER

AMBICLEAN
8000 - 12000 - 16000

SAFETY INSTRUCTIONS FOR OPERATING AND MAINTENANCE

No EM61000074 - EM61000075 - EM61000076

ISSUE : EN
REVISION : A
DATE : 09 - 2024

Instructions

REF: 8695 8028

Original instructions

LINCOLN® ELECTRIC

Thank you very much for the trust you have shown by choosing this piece of equipment. It will give you trouble-free service if it is used and maintained as recommended.

Its design, component specifications and manufacturing are in accordance with applicable European directives.

Please refer to the CE declaration enclosed to identify the directives applicable to it.

The manufacturer shall not be liable for any combination of parts not recommended by it.

For your safety, please follow the non-limitative list of recommendations and obligations, a large part of which are included in the Labour Code.

Please inform your supplier if you find any error in this instruction manual.

Table of contents

INFORMATION

This technical literature is intended for the following machines or products:

- **AMBICLEAN 8000** ☛ air cleaner EM61000074
- **AMBICLEAN 12000** ☛ air cleaner EM61000075
- **AMBICLEAN 16000** ☛ air cleaner EM61000076

These instructions and the product covered by them refer to applicable standards.

Use of the equipment:
Please read this manual before you start handling, installing or using the machine. Keep the manual safe in a place known to the machine user and maintenance personnel until the machine is finally destroyed.
This manual explains how to transport, install, use and maintain the machine. It cannot in any event replace the experience of the user for operations of varying difficulty.
Before the machine is used by a new user, make sure that they have read this manual and understood all the explanations provided.
For any further information, please feel free to contact the technical staff of **LINCOLN ELECRIC**.

Display and pressure gauge:

Measurement instruments or displays of voltage, intensity, speed, accuracy etc. are to be considered as indicators, whether they are analogue or digital.

In spite of all the measures applied, invisible residual risks may still remain.
Residual risks can be reduced if the safety instructions are observed, the machine is used as recommended and general service instructions are followed.

Machine guarantee:
This machine is guaranteed for 12 months from the date of purchase.
During the first 12 months of use, defective parts shall be replaced free of charge providing the damage is not the result of improper use of the machine.
The machine guarantee shall cease automatically when the machine is no longer the property of the original buyer.
The terms of validity of the guarantee shall be subject to verification and acceptance by our sales department.
Any nonconforming use that could damage the machine shall not be covered by the guarantee.
For the guarantee to operate, the equipment must be inspected by our technical department.

Assistance:

LINCOLN ELECRIC is at your disposal for any work on your equipment.
Please send any requests to the technical department.

HOT LINE (+33) 825 132 132

MEANING OF SYMBOLS

	Reading the manual/instructions for use is mandatory.		Indicates a hazard.
	Mandatory use of safety shoes.		Warning of an electricity risk or hazard.
	Mandatory use of hearing protection.		Warning of a risk or hazard due to an obstacle on the floor.
	Mandatory use of a safety helmet.		Warning of a risk or hazard of falling with a level change.
	Mandatory use of safety gloves.		Warning of a risk or hazard due to suspended loads.
	Mandatory use of safety glasses.		Warning of a risk or hazard due to a hot surface.
	Mandatory use of a safety visor.		Warning of a risk or hazard due to moving mechanical parts.
	Mandatory use of safety clothing.		Warning of a risk or hazard due to a closing movement of mechanical parts of a machine.
	Make sure you clean the working zone.		Warning of a risk or hazard due to laser radiation.
	Mandatory use of breathing protection.		Warning of a risk or hazard due to an obstacle at a height.
	Visual inspection required.		Warning of a risk or hazard due to the presence of a pointed part.
	Indicates a lubrication operation.		Wearers of pacemakers may not be admitted in the designated area.
	Requires maintenance action.		

DECLARATION OF CONFORMITY

LINCOLN ELECTRIC FRANCE SAS

AMBICLEAN AIR CLEANER

CE DECLARATION OF CONFORMITY

1) CE/EU DECLARATION OF CONFORMITY

Dear customer,
This CE/EU declaration of conformity certifies that the supplied equipment complies with applicable laws and regulations when used in accordance with the enclosed instructions. Any other assembly or modification would void our certification. That is why you are asked to call in the manufacturer for any modifications you wish to make. Failing that, the company responsible for the modification must repeat the certification process. In that case, we would not be liable for the new certificate in any way. Please hand this document over to your technical department or purchasing department for filing.

DESCRIPTION: **AMBICLEAN 8000**

TYPE: **EM61000074**

NUMBER: **See name plate**

2) This equipment complies with European directives.

☒ 2006/42/EC **☒ 2011/65/EU** **☒ 2014/30/EU**

3) Based on the following harmonised standards:

- **EN ISO 12100: 2010**

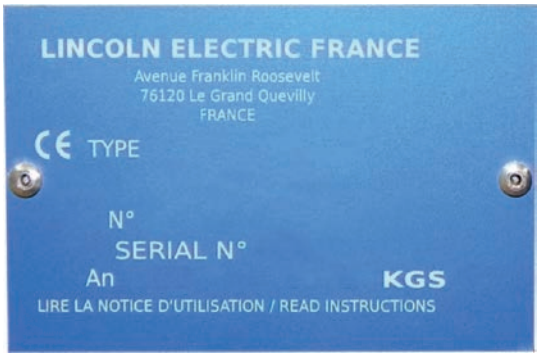
A - IDENTIFICATION

The information below should be provided in all correspondence.



1 - Limits of use of the machine

The limits of use of the machine are provided in the different documents; please review them carefully before starting to use the machine.

For safety reasons, the working area may only be occupied by one individual.

The machine may only be operated by a single person above the age of 18 and trained in operating and use-related risks.

The machine may only be used for filtering cutting fumes; any other use of the machine is forbidden.

Mechanical or electrostatic filtration systems are effective for the filtration of solid particles, but not gaseous particles.

The machine is designed for outdoor discharge.

If the fumes are discharged indoors (not recommended), the workshop in which fumes are discharged must be ventilated so as to not reach the professional exposure limit value of pollutants (fumes and gases)

Field of application:

Filtration of solid particles and dry dust, non-flammable gas, with no risk of explosion.

- Zinc, paper, flour, plant leaves, graphite, aluminium from grinding and sanding etc. and other such dust is to be excluded, because electrostatic discharge or welding splatter would present a risk for those using the filter.
- The air flow through the filter medium must not be at a temperature above 80 °C.
- This machine is not designed for extracting chemicals.
- The choice of equipment is made to suit the pollutants to treat. Extraction at source of the pollutant is only effective if the machine is operating at its nominal power (air flow at the nozzle).

Take particular care to:

- Not obstruct the air outlet of the machine.
- Not introduce external elements into the filter (paper, cloths, cigarette butts etc.)
- Replace the filter medium with new original **LINCOLN ELECRIC** medium, which alone can guarantee the filtration characteristics.
- Replace the hoses if they are pierced.
- Regularly clean the metal pre-filter on those machines that have one.

Specific case of chlorine solvents (used for cleaning or degreasing):

- **The fumes of such solvents turn into toxic gas when they are subjected to arc radiation.**
- **Such solvents may not be used with parts to cut, as they cannot be filtered by the Digifilter.**

The energy supply must imperatively comply with recommendations.
The customer must supply and install a device for isolating each utility source (electricity, air). The devices must be clearly identified. They must be of the locking type.

The machine is designed for professional use.

Before use, the operator must make sure that there is no risk of collision with personnel.

Before using the machine, make sure that all the guards are in place.

“No climbing on the structure of the machine other than on platforms or gangways designed for that purpose.
To access equipment at heights, the user must use accessing means in accordance with the regulations, such as a safe mobile gangway, an aerial lift etc.”.

Never modify the machine.

The machine is not designed for anchoring lifting equipment.

The use of Personal Protective Equipment (PPE) and work clothing covering the body is mandatory in the work area. Do not wear a tie and keep your hair tied back securely.

Upon the installation of the AMBICLEAN air cleaner:

- **Make sure that the emergency stops of the machine are interconnected.**
- **Check that the fan is rotating in the correct direction.**
- **Check that ground connections are made correctly.**

For any extended absence, the operator must shut off the supply of utilities (electricity and fluids)

Maintenance may only be carried out by experienced personnel who are trained in machine-related risks.

Access to the machine must be left free for maintenance (e.g. no workpiece etc.).

The frequency of such maintenance is indicated for production in one work shift per day (i.e. 8 hours a day).

Consumables (filter) must be changed based on their wear and tear.

Visually inspect the overall condition of the machine and the working area twice a shift, or with every change of production.

The maintenance schedule must absolutely be followed.
We recommend putting in place a traced system for tracking all your maintenance operations.

All maintenance must be carried out by specialised personnel who have read and understood this manual.

Electricity technician

☛ **Qualified operator with the skills for working in normal conditions on electrical components for regulation, maintenance and repair.**

Mechanical technician

☛ **Specialised technician authorised to carry out complex and exceptional mechanical operations.**

2 - Residual risks

Based on the results of the risk assessment, a few elements have emerged where there was no “technical” solution for eliminating risk or making it negligible.

In spite of all the care that has gone into the designing of our machines, some risk areas remain.
To control these risks, the customer must pay particular attention to them, ensure that the instructions are applied and define any additional measures that may be necessary in view of its own internal operating procedures.

Therefore, you will find below a guidance list of residual risks.
Training of operators in safety and in the use of the machine from their operating position will better address these residual risks.

We recommend putting in place workstation instructions that remind users of the presence of residual risks in the working area.

2.1 - Residual risks - General

☛ **Environment risk - slipping and/or falling**

The working and safety area must be clear of all obstacles.

The working area must be kept clean and cleaned regularly.

The machine must undergo periodic maintenance (see maintenance instructions of each piece of equipment). In particular, cutting dust around the machine must be cleaned.

The operator must pay special attention to cables on the floor.

The operator must use the necessary personal protective equipment (helmet, gloves, safety shoes, mask and work clothing)

While unpacking the **AMBICLEAN** air cleaner, the area around it must be sufficiently large and clear, in order to avoid falls.

Falling from heights:

In order to be protected from falling from heights and for access to high parts, the operator or technician must use access means that comply with applicable standards (e.g. during the assembly, disassembly or maintenance of ducts).

For all work at heights, the use of personal protective equipment (helmet, gloves, safety shoes, mask, ear muffs and harness) is indispensable.

For all work at heights, the operator must be trained in the use of means for accessing high locations.

☛ **Mechanical risk - Impacts, shearing, crushing**

The operator may not wear loose clothing or a tie, must have their hair tied back and use personal protective equipment (helmet, gloves, safety shoes, mask and work clothing).

The operator must make sure that nobody else is close to the machine before starting.

The **AMBICLEAN** air cleaner must not operate when any of the extraction components (pre-filter, filter) are missing.

The operator must make sure that all the machine guards are in place before using it.

Before any work on a part of the extraction system (electrical or other), the system must be disconnected using the disconnecting switch.

Even after taking that precaution, mind the fan components, which can remain in motion due to the windmill effect (blades driven by air flow).

The operator’s working position is before the control console.

The machine safety areas must not be crossed.

The operator must be trained in the use of the machine, and all personnel must be aware of residual risks.

Tipping over of the **AMBICLEAN** air cleaner during installation or moving, presence of a worker under the load.

The extraction system may not be modified.

The weights and positions of the forks are indicated in this document. The handling equipment must be rated for those requirements.

Any change in the machine location must be made by **LINCOLN ELECRIC** or personnel trained in handling

The operator must be trained in the use of the machine, and all personnel must be aware of residual risks.

☛ **Mechanical risk - Puncturing or piercing**

The use of personal protective equipment (gloves, safety shoes, work clothing) is indispensable during unpacking and installation.

Such equipment is indispensable while installing the fume extraction ducts (sharp parts.

The operator must be trained in the use of the machine and all personnel must be aware of residual risks.

2.2 - Residual risks during operation or simple maintenance

☛ **Electrical risk - Electric shock or electrocution**

Contact with electrical parts:

Access to the electrical cabinet must be restricted to authorised personnel.

Before any work on a part of the extraction system (electrical or other), the system must be disconnected using the disconnecting switch.

Important: With the optional ICP, cables connected to the fan may remain live for several minutes after the machine has been disconnected.

From time to time, check that the machinery and its electrical accessories - connectors, flexible cables and extension cords - are correctly insulated and connected.

Work for maintaining and repairing insulating ducts and enclosures may not be carried out in a haphazard manner.

- All repairs are to be carried out by specialists, or better yet, defective accessories should be replaced.
- Regularly check that the electrical connections are tight, with no heating

The use of personal protective equipment (helmet, gloves, safety shoes, mask, ear muffs, fire-resistant work clothing) is indispensable.

The operator must be trained in the use of the machine, and all personnel must be aware of residual risks.

☛ **Ergonomics risk - Fatigue**

Changing/emptying containers:

The operator must use appropriate handling means.

The operator must be trained in the use of the machine, and all personnel must be aware of residual risks.

☛ **Material and product risks - Poisoning**

Emission of fumes/dust:

Important: while changing or cleaning the filter, the extraction system must be disconnected from the electricity source. The application of an emergency stop is not sufficient. Indeed, unclogging can start away from fan operation.

The use of personal protective equipment (helmet, gloves, safety shoes, mask, ear muffs, work clothing) is indispensable.

The efficiency of the extraction system must be inspected regularly and corrected if it is not adequate (e.g. by cleaning the pre-filter, changing the filters, inspecting all piping).

Any fans placed in a circuit in which the air is laden with dust must be cleaned from time to time. That is because the turbine may be fouled and become unbalanced, leading to increased noise and premature wear and tear of bearings. Maintenance is required at least after every six months, depending on the type of dust treated.

The fan is an essential element of your extraction system.

Incorrect operating or inadequate maintenance could make the operator less safe. That is why the fan must be maintained in perfect condition.

Your installation has been selected for a specific application. The turbine is characterised by an operating point based on extraction speed (speed of air in the piping) and head loss.

In accordance with the regulations of CARSAT and INRS, the system must be inspected from time to time to make sure that it continues to comply with its reference values.
Used filters and dust in the containers must be placed in appropriate locations and then reprocessed in accordance with the standards of the country in which the system is installed
The operator must be trained in the use of the machine, and all personnel must be aware of residual risks.

☛ **Mechanical risk - Puncturing or piercing**

Contact with a part of the pneumatic circuit that is under pressure
Before any work on the pneumatic circuit, the pneumatic supply must be switched off and the circuit must be purged (Caution! There is a 22-litre reserve) to avoid any accidental lashing of the hoses.

The use of personal protective equipment (helmet, gloves, safety shoes, mask, ear muffs) is indispensable.
The operator must be trained in the use of the machine and all personnel must be aware of residual risks.

☛ **Thermal risk - Burns**

Part of the body in contact with a hot component (while emptying containers, changing filters)
The use of personal protective equipment (helmet, gloves, safety shoes, mask, ear muffs) is indispensable.
The operator must be trained in the use of the machine and all personnel must be aware of residual risks.

☛ **Noise risk - Fatigue**

Process noise
The use of personal protective equipment (helmet, gloves, safety shoes, mask, ear muffs) is indispensable.
The operator must be trained in the use of the machine and all personnel must be aware of residual risks.

1 - Overall description

For your safety and optimum performance, please read this manual carefully before using the filter.

Delivery:

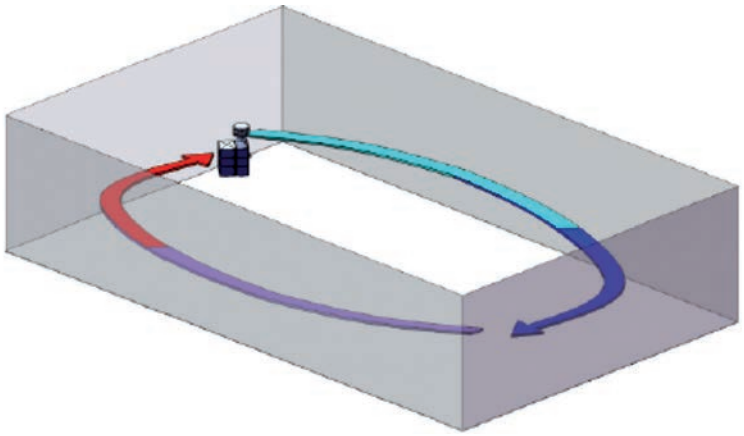
In addition to observing the **OEL** (**O**ccupational **E**xposure **L**imit) applicable to the concentration of weld fumes to which the welder's respiratory tract is exposed, attention must also be paid to the overall concentration present in workshops.

Extraction at source or local extraction of weld fumes are not always adequate for maintaining a healthy working atmosphere in accordance with standards.
Welding processes generate fumes that rise in view of their temperature.
As they cool, these fumes stagnate at a height between 4 and 6 m and create a bluish haze in the workshop.

That is why **LINCOLN ELECRIC** has developed a solution to clean up the ambient air in working areas by means of a general air filtration system of the **AMBICLEAN** type.

The AMBICLEAN solution:

The **AMBICLEAN** air cleaner sets the stagnant cloud of fumes in motion, collects it, filters it and recycles it into the workshop by means of guide blow nozzles that generate the air cleaning loop.
The fumes thus collected do not have the time to cool and drop, making the working environment clean.



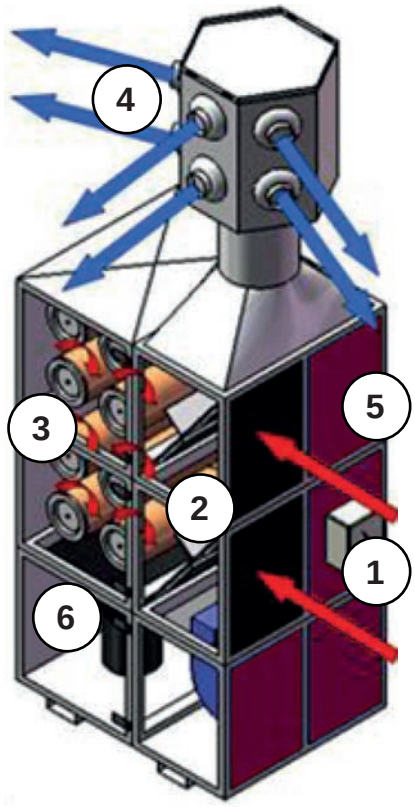
Use:

The **AMBICLEAN** air cleaner must be kept operating continuously, not only during welding work, as the principle is to continuously clean the air to ensure that the level is below the OEL.

Dust filtration is very effective, but welding gases are not treated safely by any system, and so we recommend bringing in fresh air in a volume that is 20% of the air treated by the **AMBICLEAN** air cleaner.

We recommend starting up the system 1 hour before the start of work and delaying stopping by 2 to 3 hours after the end of work for proper cleaning.

Operating principle:



Operating principle of the AMBICLEAN air cleaner	
1	The AMBICLEAN air cleaner puts the stagnant cloud of fumes in motion and collects it through its lateral suction openings as it cools
2	At the cleaner inlet, polluted air flows through metal pre-filters that keep incandescent particles out of the filtration area.
3	The polluted air is then distributed in the filtration area and flows through filter cartridges that purify the air up to 99.9%.
4	The filtered air is blown into the workshop by guide blow nozzles that generate an air cleansing loop.
5	The filter cartridges are unclogged by a strong surge of air inside the cartridges
6	The dust driven out of the cartridges falls into the recovery hopper. The waste is removed using the dust drums

Composition of the AMBICLEAN air cleaner:

The sandwich panel and metal structure design optimises the weight and strength of the machine, while guaranteeing sealing against the fine dust treated.
It can be put in place easily thanks to its monobloc construction, which helps minimise noise.
The filter is managed by a PLC associated with a 5.7” HMI screen.
That helps monitor the operating condition, maintain the quality of internal filtering elements and ensure an effective and continuous extraction rate.

Benefits:

- Continuous filtration of polluted air, with H13 filtration class and a constant flow of air.
- Reduction of the overall pollutant concentration in the area.
- Ease of installation, with no network of ducts, thus cost effective.
- No heat loss or draughts that could disturb welding.

Main characteristics:

- The operating cycle is managed by a PLC associated with a 5.7” HMI screen.
- Self-cleaning of cartridges during operation.
- High filtration efficiency thanks to filter cartridges with PTFE membrane.
- Three operating modes are possible: Manuel – Weekly clock – Automatic.
- Compact design/ease of installation/low noise
- Low maintenance that can be scheduled from the human machine interface (HMI) screen.

Delivery:
The **AMBICLEAN** air cleaner is delivered in two or three parts to be assembled on the site, with appropriate lifting equipment:

- The upper part of the **AMBICLEAN** extraction unit, including the filtration and unclogging components,
- The lower part of the extraction unit, which includes the fan motor unit and the circuitry,
- And the extraction head including the blow nozzles.

4	Date and time setting
5	Operating mode: • Manual • Weekly clock • Automatic
6	Unclogging screen (circled in green if active)
7	Compressed air pressure
8	Fault management

5 - Operating principle

5.1 Features

The **AMBICLEAN** extractor has a touch screen HMI, which, combined with a PLC, makes it possible to gather all the controls and the display of values in real time.
The unit may be controlled according to three operating modes: manual/automatic/clock.
Real-time monitoring of the system pressure driven into the blow nozzles at the extraction unit outlet, the pressure difference due to fouling of the filter cartridges, fan power consumption, fan operating frequency, and compressed air pressure of unclogging cylinders.
Programming of a weekly working time. Management of the maintenance of the extraction unit with information about the number of hours of use, filter cartridge replacement, fan maintenance, emptying frequency of dust containers.

5.2 Specificities of the AMBICLEAN air cleaner

ICP function

For smart, cost-effective and environmentally-friendly use, the **AMBICLEAN** air cleaner may be fitted with an ICP function.
This function allows finer and more advanced management of the working of the extraction unit, particularly with:

- a variable frequency drive,
- the possibility to regulate the extraction rate in relation to a fixed setpoint,
- the possibility to operate with a variable rate depending on the number of open sensors,
- real-time display of the main system vacuum settings at the filter inlet, filter cartridge pressure difference, fan power consumption, operating frequency etc.

Saturation alarm

The **AMBICLEAN** air cleaner has an alarm system that monitors the cartridge saturation condition.
The pressure difference through the cartridges is continuously monitored. When the boundary value of the pressure difference is reached (700Pa by default), a safety indicator on the HMI screen is displayed and a fault is recorded. In that case, the metal pre-filters and filter cartridges must imperatively be inspected.

Process efficiency control alarm associated with the ICP function

The **AMBICLEAN** air cleaner continuously monitors the vacuum at the filter inlet and outlet. The information measured is displayed in Pascal on the Measurements screen of the HMI. If the permitted values are exceeded, the screen displays a min or max process efficiency fault and the Out of Order sign. That major malfunction must be remedied to retain the efficiency of the **AMBICLEAN** air cleaner.

Filter cartridge cleaning

The pressure difference through the cartridges is continuously monitored. When the difference exceeds the permitted vacuum limit, a cartridge cleaning cycle starts. Once cleaning is complete, a check validates or not the negative pressure after cleaning.

Offline cleaning

This system makes it possible to clean the cartridges when the fan stops, and allows deep regeneration of cartridges. The number of cycles can be programmed in the Unclogging page of the HMI. A number of 3 to 9 cycles is recommended.
By back blowing the cartridges with an air flow and shock wave combination, most of the particles are driven out of the cartridges and fall into the recovery hopper and dust container.

This type of cleaning is required with all applications and guarantees the proper working of the installation.

5.3 Unclogging operating cycle chart

Filter cartridge unclogging operates with the help of two digital vacuum sensors, C1 and C2.
For the proper working of the extraction unit and for maintaining satisfactory extraction values, it is essential for the cleaning (unclogging) cycle to be carried out.

Online unclogging:

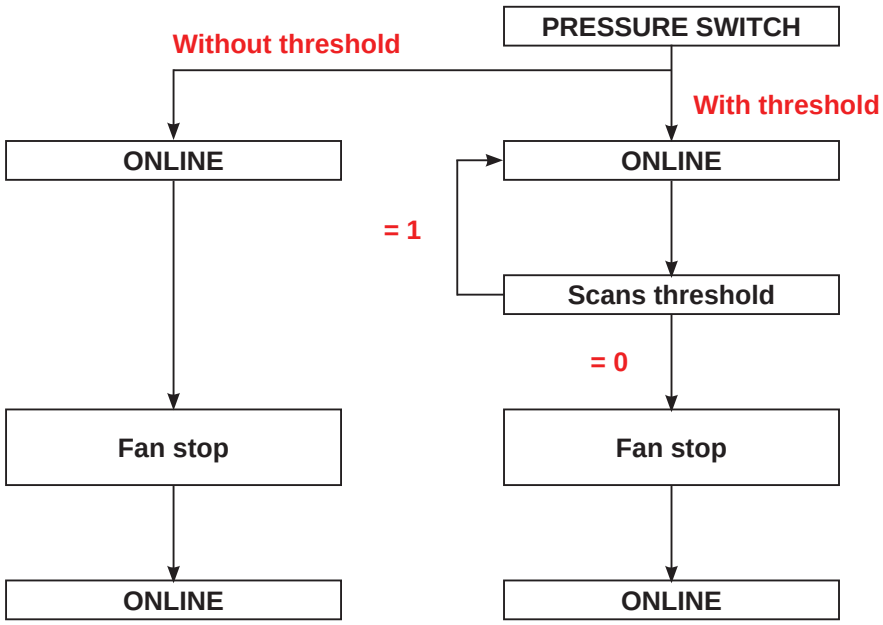
Two operating modes can be selected for the online unclogging of cartridges, with the fan operating:

- **Permanent online unclogging (no threshold):**
  Online unclogging cycle when the fan is operating.
  Online unclogging is permanent and is timed in accordance with the settings on the Unclogging page of the HMI.

- **Online unclogging with threshold:**
  Online unclogging cycle during fan operation according to a preset saturation threshold (700 Pa).
  This cycle makes it possible to extend the life of cartridges. When the saturation threshold is reached, the Online unclogging cycle starts.
  The benefits of this mode are:
  - Reduced cartridge wear and tear
  - Reduced air consumption
  - Reduced maintenance
  - Constant head loss in the filter
  - Reduced noise

Offline unclogging:
Offline unclogging cycle after the fan has stopped.
Only cycle for the effective cleaning of filter cartridges because it is carried out with the fan halted.
It allows the dust to fall into the dust container by gravity.
The offline unclogging time depends on the number of filter cartridges and the number of cycles, as set on the Unclogging page of the HMI.

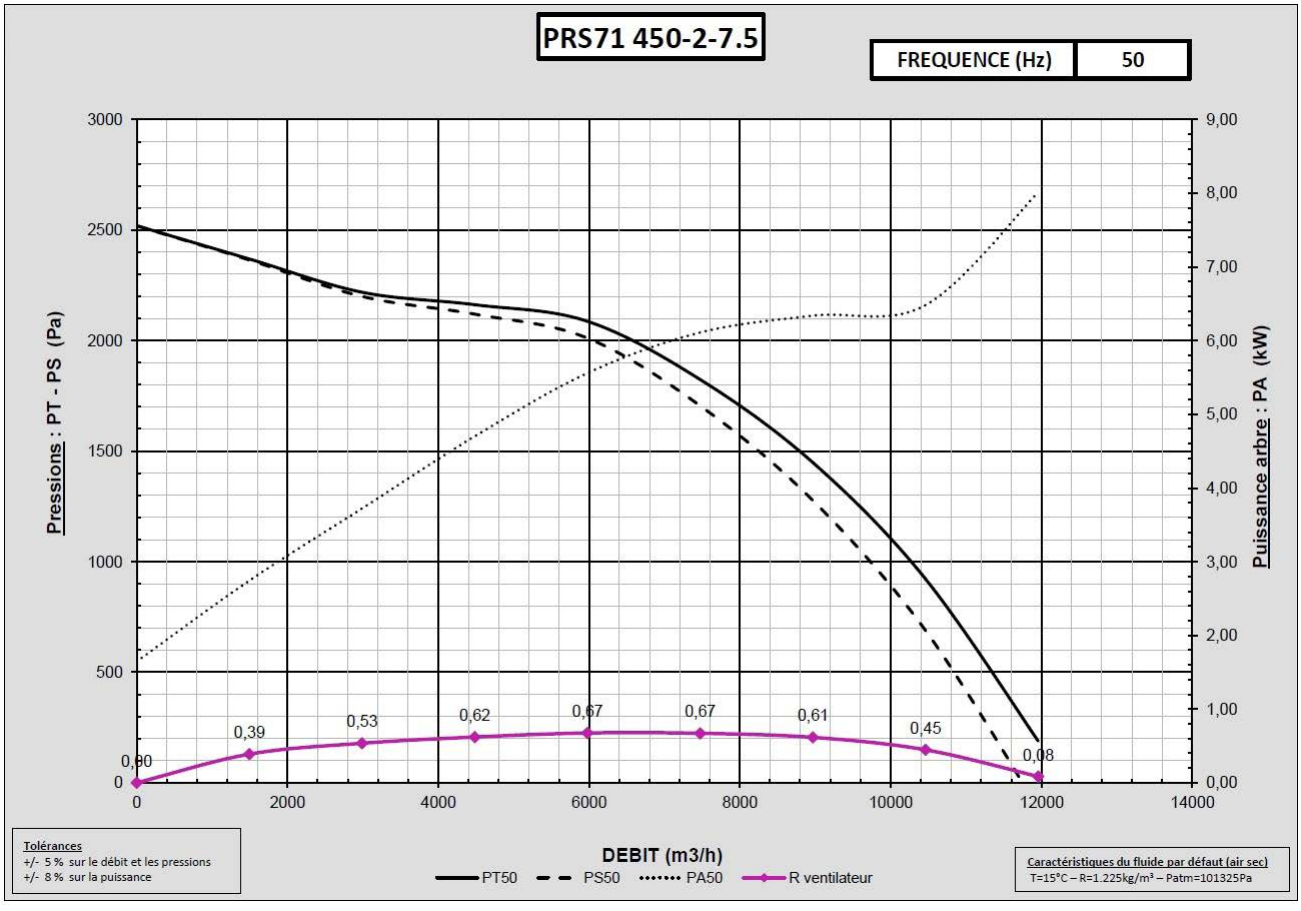
The offline unclogging cycle must necessarily be followed.
- The air cleaner must not be shut down before the end of the cycle.
- The system compressed air must not be switched off before the end of the cycle.



6.1 AMBICLEAN 8000

Type	Centrifugal fan, PRS71 450 – 2 poles
Power	7.5 kW
Operating point	9000 m³/h at 1200 Pa at 50 Hz
Voltage	400V
Frequency	50Hz
Rotation speed	2800 rpm
Noise	79 dB (free field)
Fan inlet Ø	450 mm

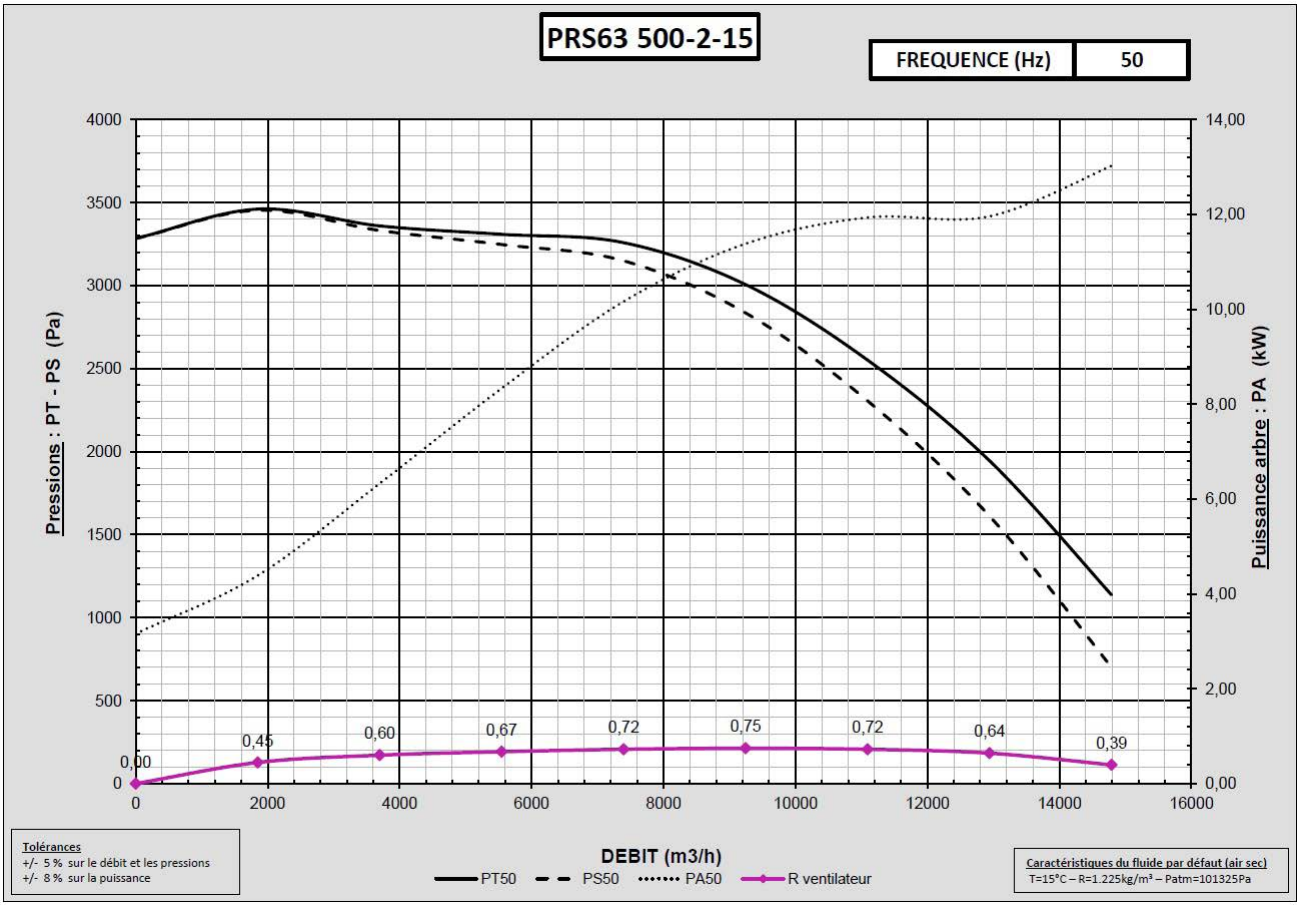
Fan, PRS71 450 - 2 - 7.5 kW



6.2 AMBICLEAN 12000

Type	Centrifugal fan, PRS63 500 – 2 poles
Power	15 kW
Operating point	13000 m³/h at 1500 Pa at 50 Hz
Voltage	400V
Frequency	50Hz
Rotation speed	2800 rpm
Noise	84 dB (free field)
Fan inlet Ø	500 mm

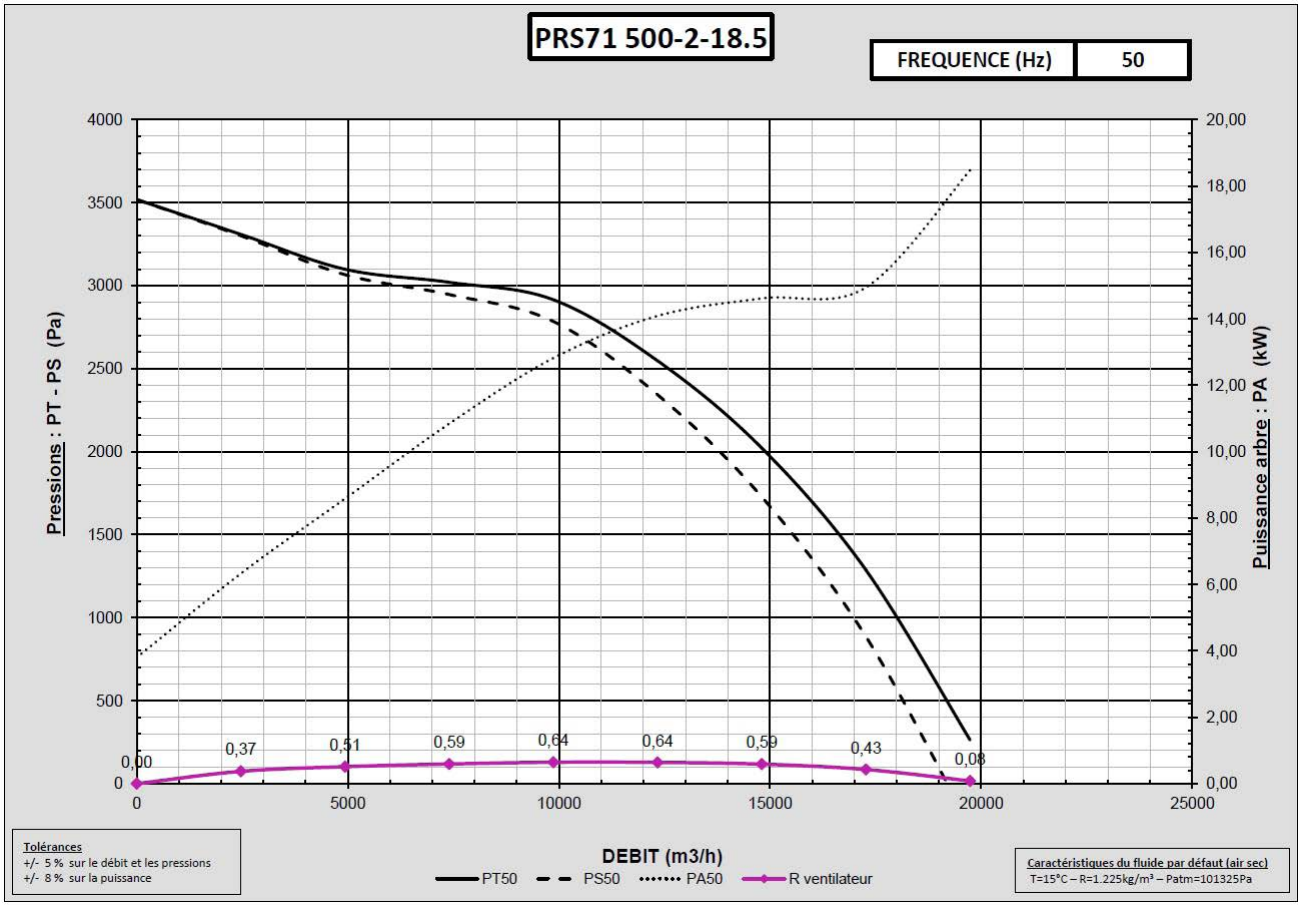
Fan, PRS63 500 - 2 - 15 kW



6.3 AMBICLEAN 16000

Type	Centrifugal fan, PRS71 500 – 2 poles
Power	18.5 kW
Operating point	16000 m³/h at 1300 Pa at 50 Hz
Voltage	400V
Frequency	50Hz
Rotation speed	2800 rpm
Noise	84 dB (free field)
Fan inlet Ø	500 mm

Fan, PRS71 500 - 2 - 18.5 kW



1 - Installation conditions

The machine must be located in accordance with safety standards to keep personnel safe.

Arrangement of cables and hoses
The customer must provide a means to support and protect cables and flexible hoses from mechanical, chemical or thermal damage.

2 - Floor preparation

Installing the **AMBICLEAN** air cleaner does not require any particular floor preparation; however, we recommend the use of concrete, asphalt or stabilised pebbles that keep the machine sufficiently stable.

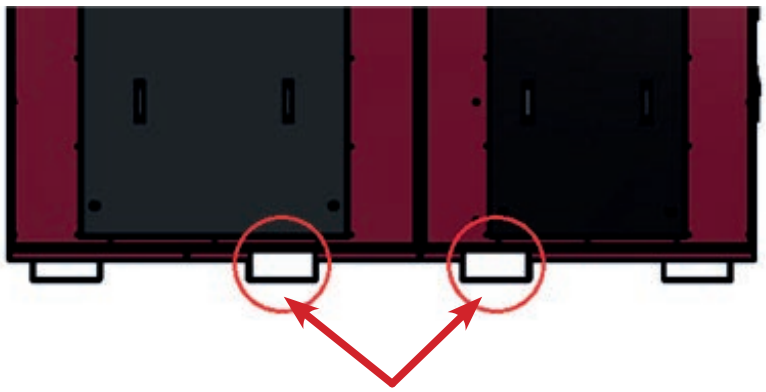
The flatness over the whole of the **AMBICLEAN** air cleaner may not exceed 0.5%.

Concrete screed in a single stretch made at least 21 days before (standard BAEL 93). The thickness of the screed and its reinforcement are given for guidance, and must be verified depending on the characteristics of the floor.

Single concrete strip. 20 Mpa (350 kg/m³) concrete with metal reinforcement.

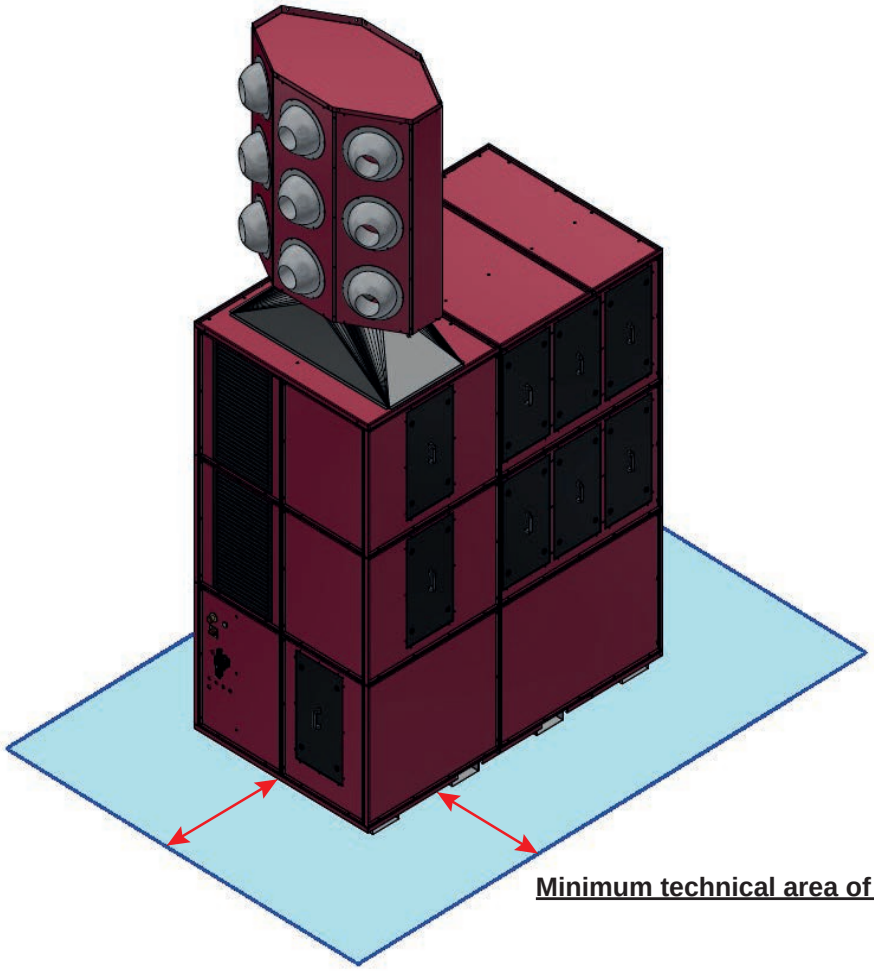
3 - Assembly

The **AMBICLEAN** air cleaner can be handled with a lift truck thanks to the fork pockets provided under the frame.



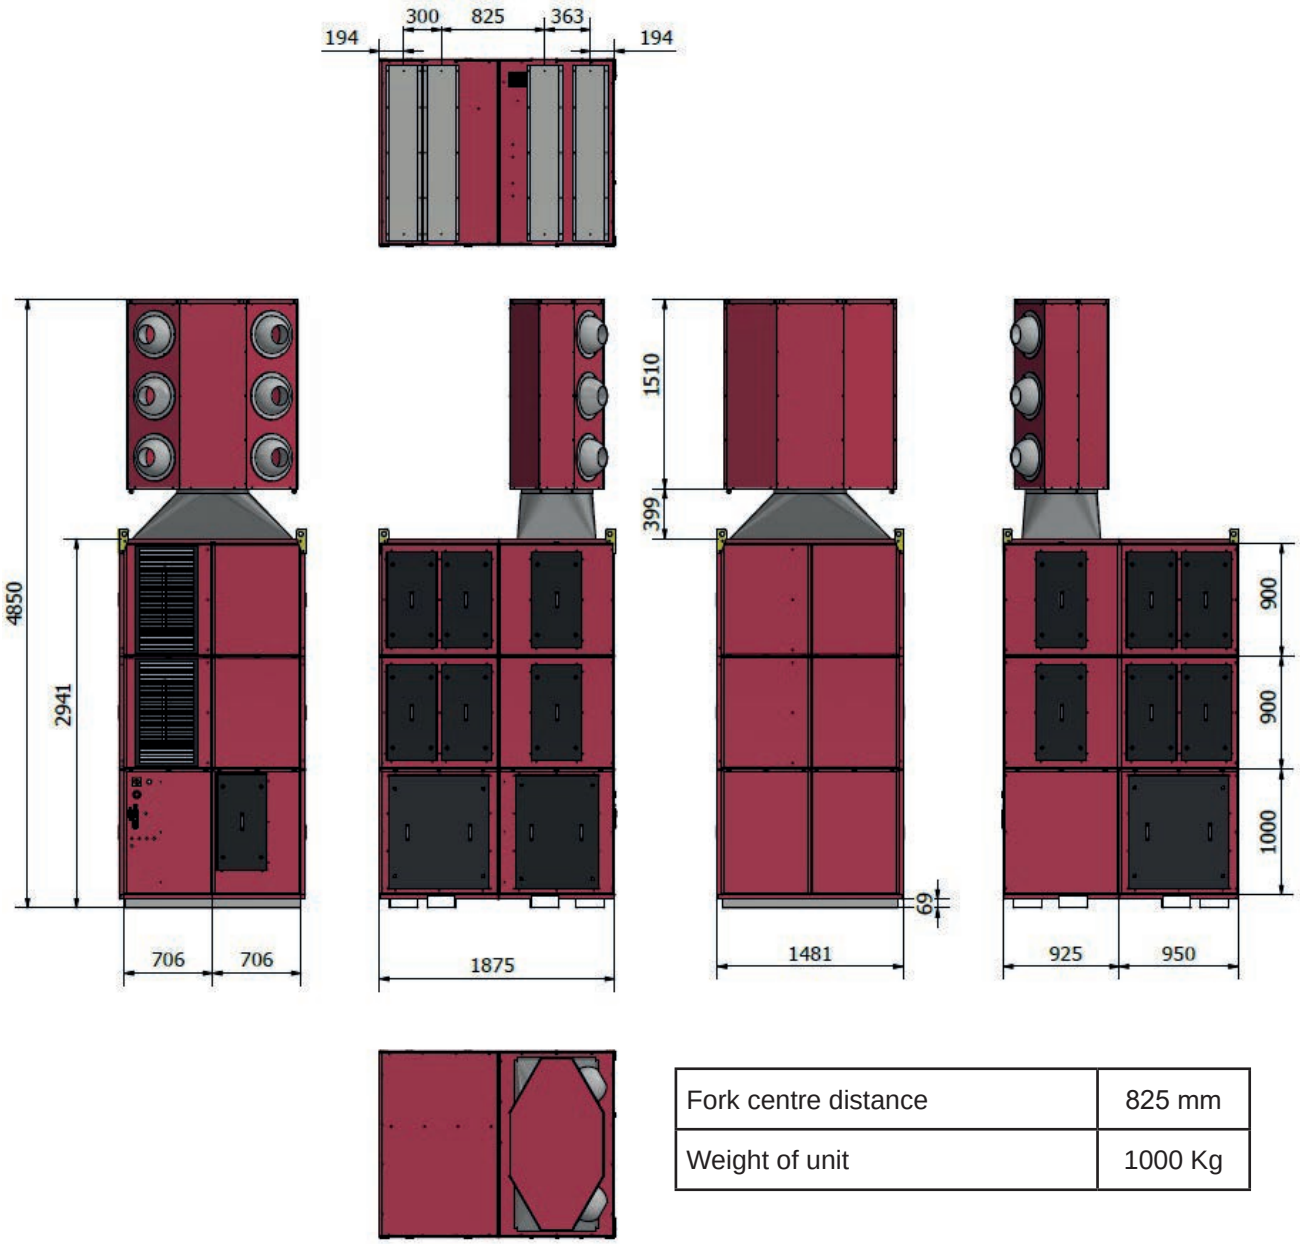
Fork pockets for lift truck

- The clearance required for opening the doors for maintenance work is 600mm.
- A 1000 mm technical area over the perimeter of the unit must be provided, particularly in the filter change area.
- Connection of the compressed air pressure reducer filter Ø16mm.



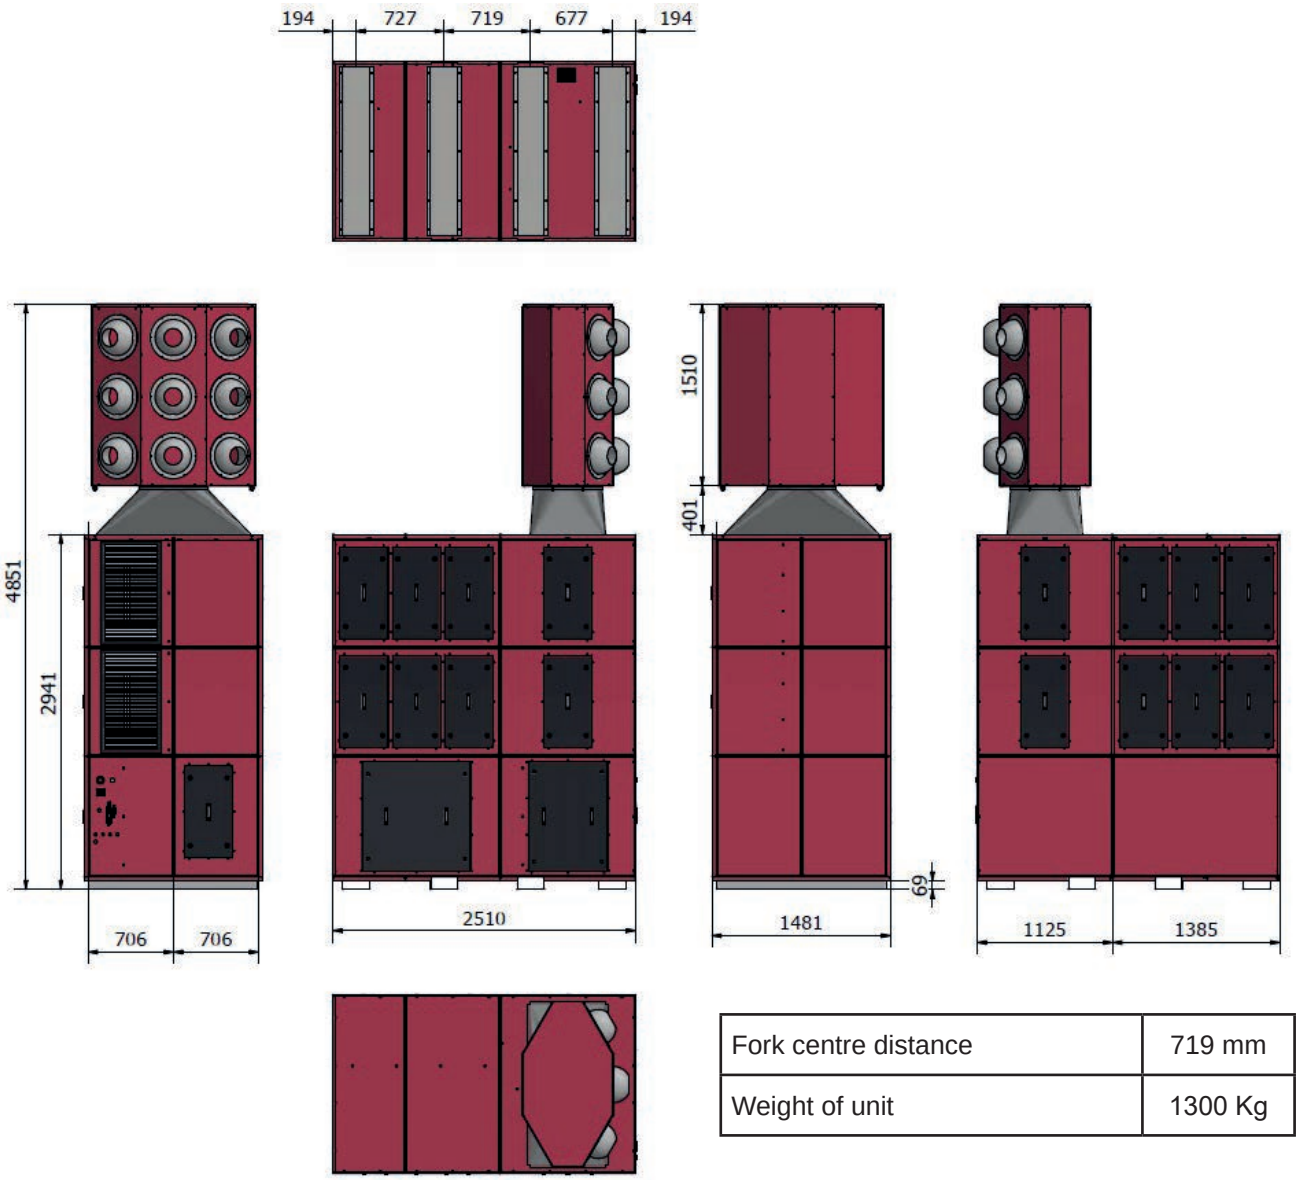
Minimum technical area of 1 metre

4.1 AMBICLEAN 8000



Fork centre distance	825 mm
Weight of unit	1000 Kg

4.2 AMBICLEAN 12000



Fork centre distance	719 mm
Weight of unit	1300 Kg

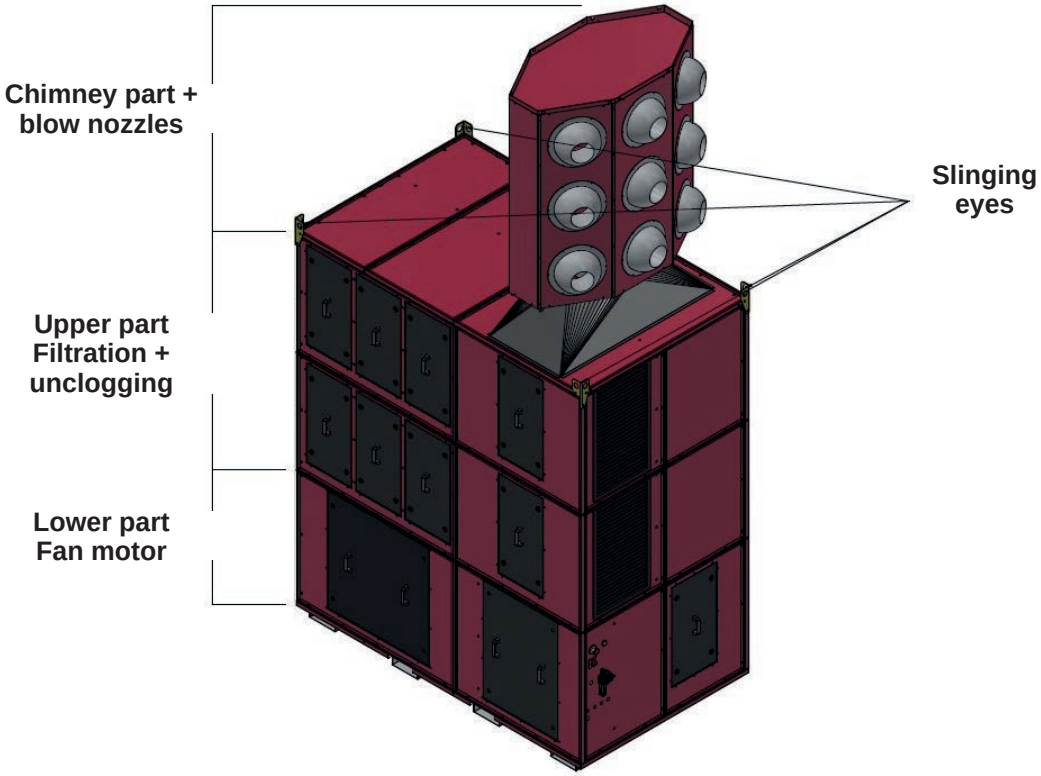
5 - Assembly of the different elements

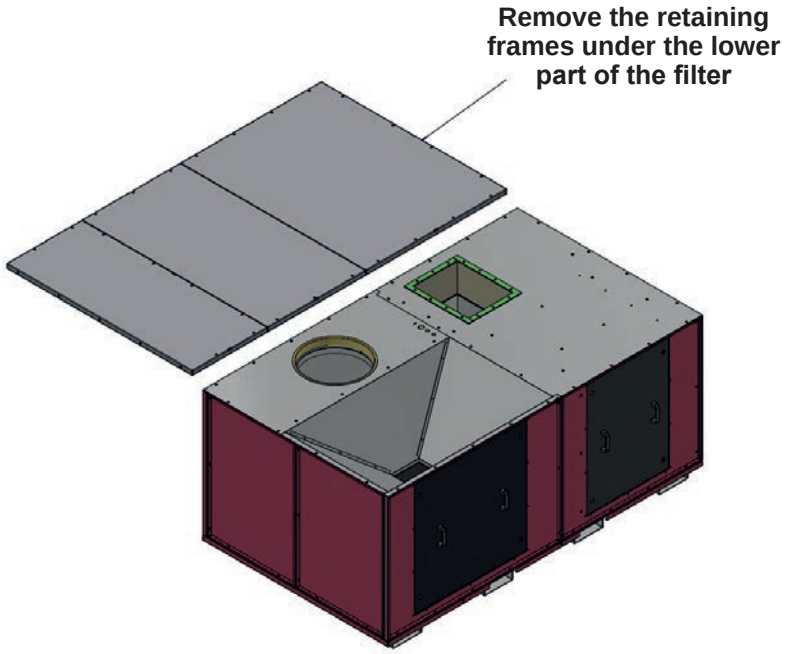
The **AMBICLEAN** cleaning unit may be delivered in two or three parts.

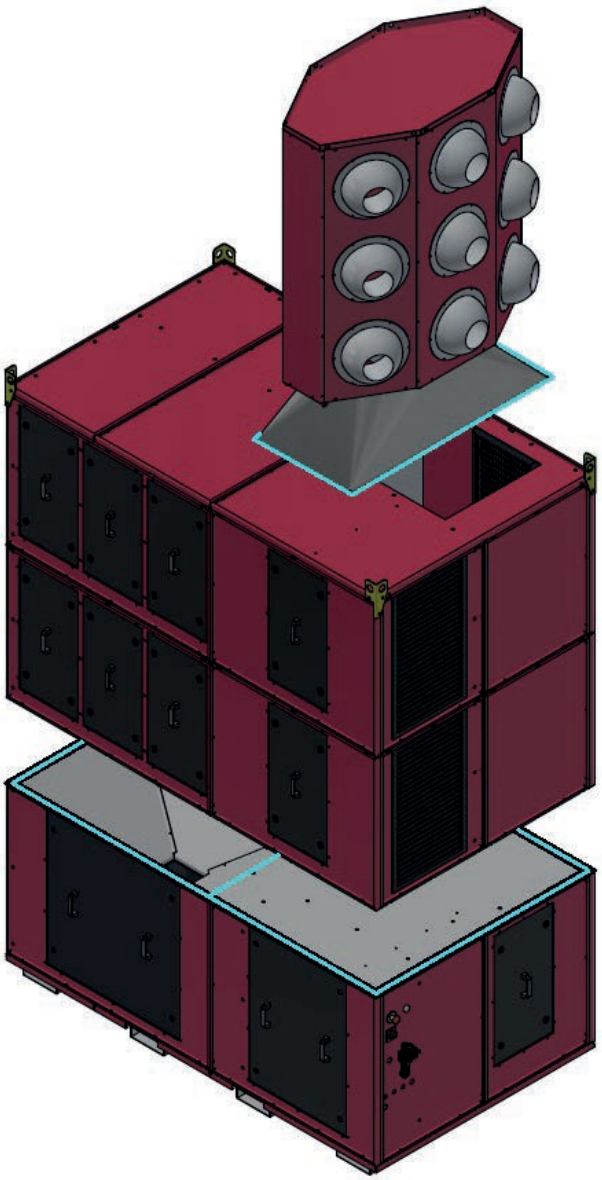
- The upper part of the unit, including the filtration components, and the lower part of the unit with the fan motor unit may have been assembled in the factory or may need to be assembled, depending on the unit version
- The chimney with the blow nozzles must be assembled last.

Assemble the elements of the extraction unit as instructed in the drawings below.

- The lower part of the extraction unit can be handled using a lift truck thanks to the fork pockets provided under the frames
- The upper part of the extraction unit can be handled using the four slinging brackets to screw to the four upper corners of the unit.
- The chimney with the blow nozzles must be slung using its upper part.



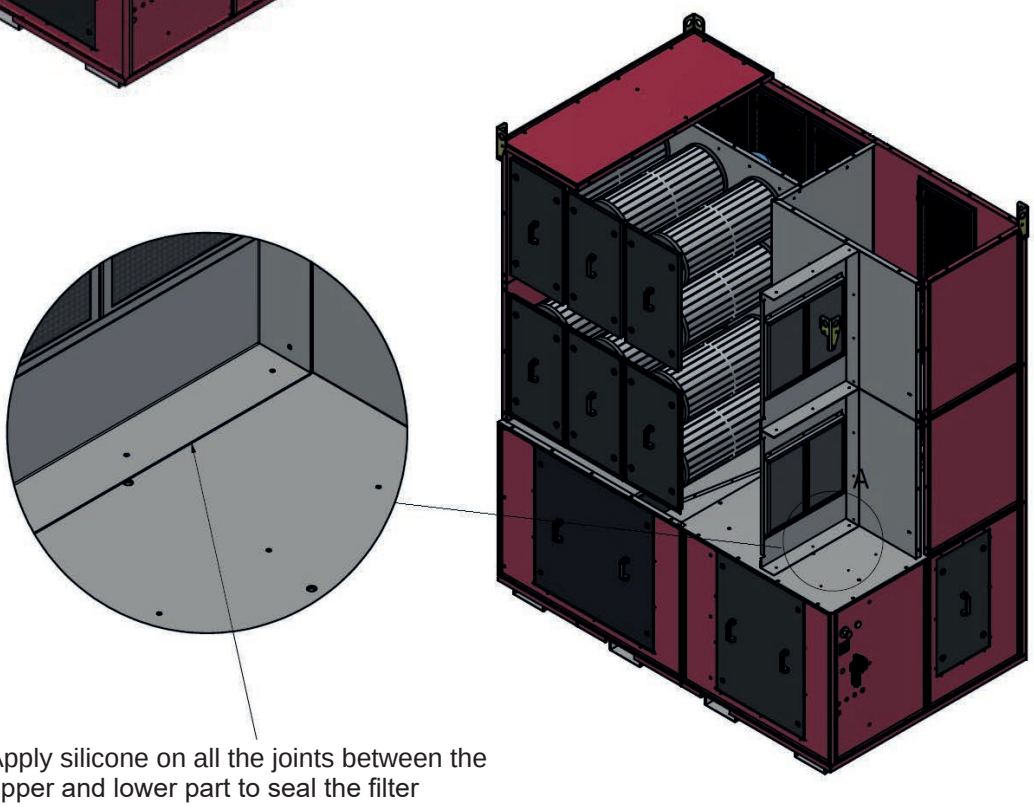




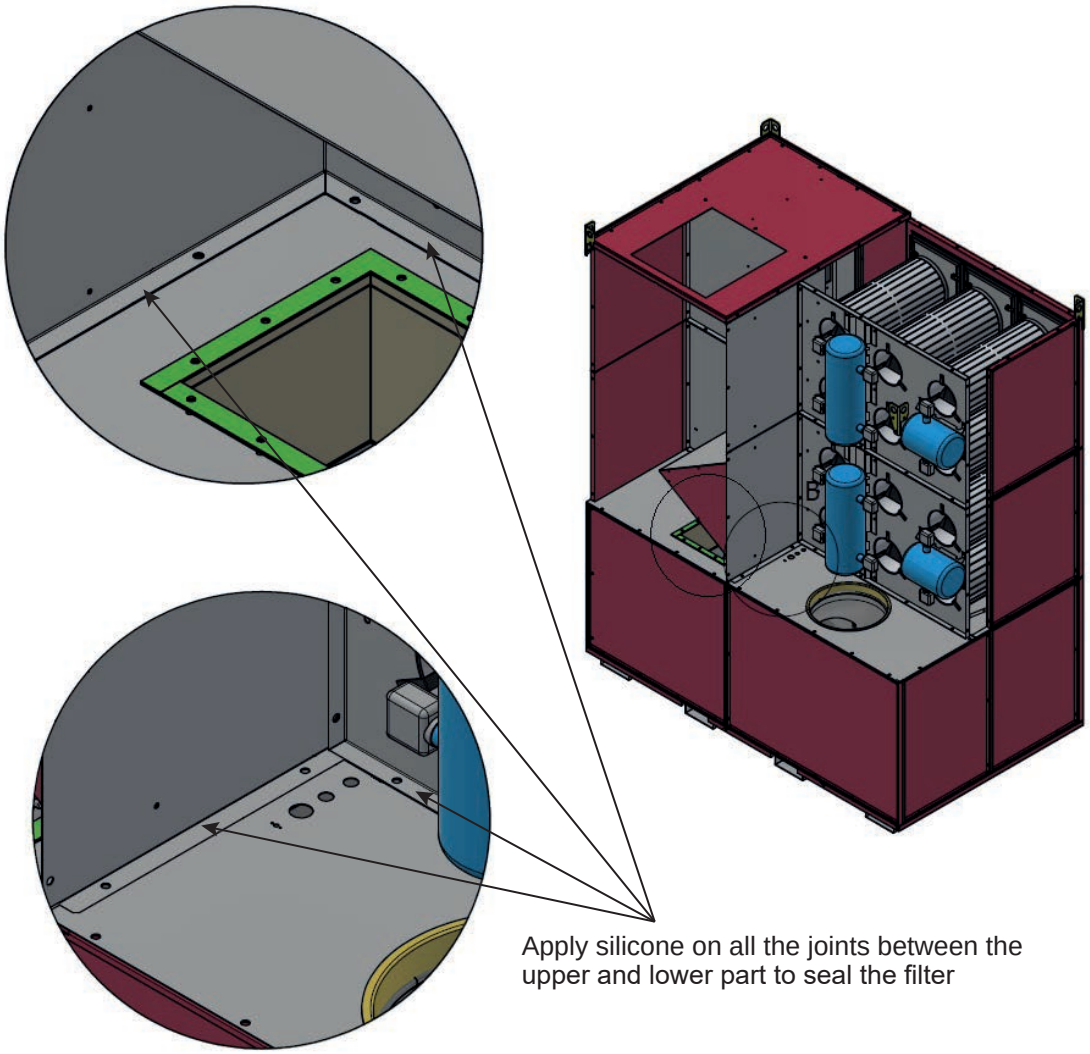
1 - Apply foam seal on all the contact surfaces between the upper and lower parts of the filter represented by the blue lines.

2 - Assemble the upper part on the lower part of the filter with the supplied screws.

3 - Route the cables in the passage provided to make the required connections in the junction box.

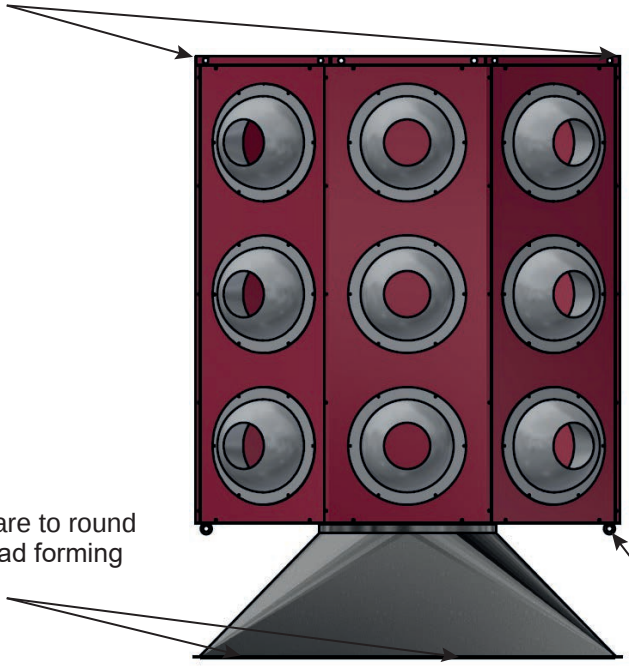


Apply silicone on all the joints between the upper and lower part to seal the filter



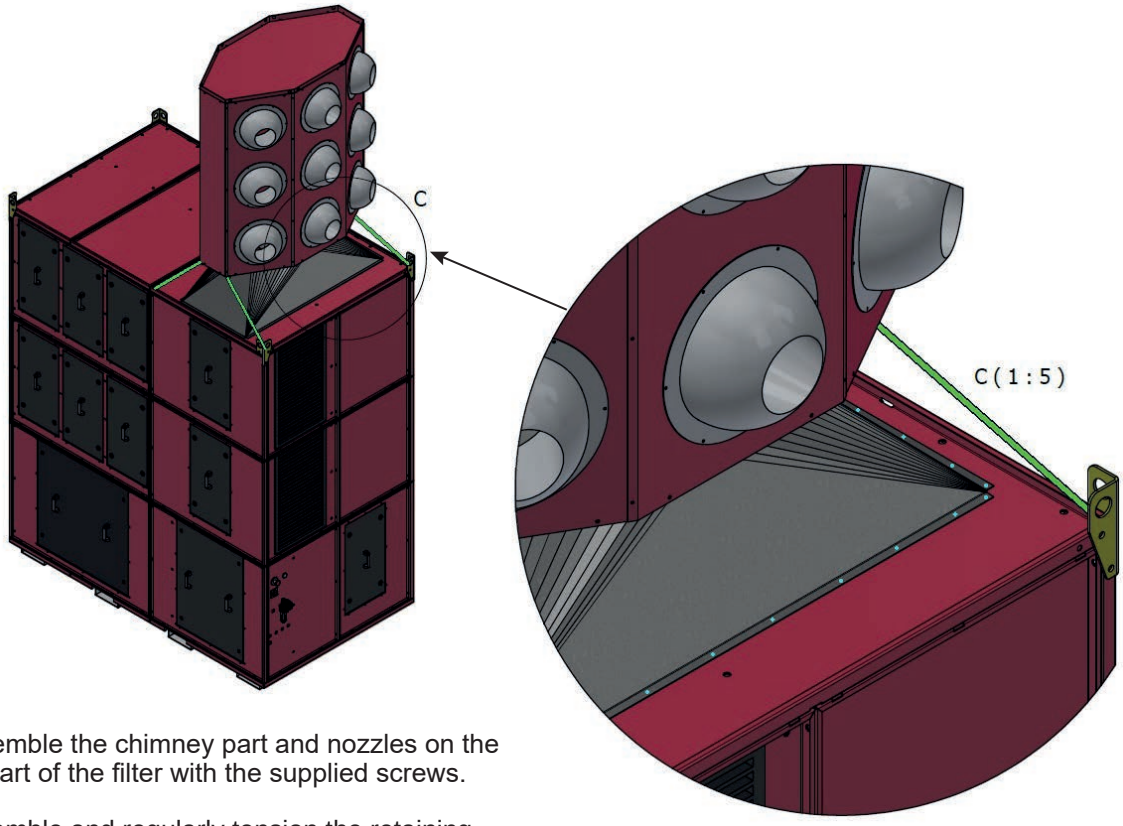
Apply silicone on all the joints between the upper and lower part to seal the filter

1 - Sling the chimney above the filter



2 - Apply sealant under the square to round adapter before fixing it with thread forming screws

x4 rings for fastening the retaining cables between the chimney and the filter



3 - Assemble the chimney part and nozzles on the upper part of the filter with the supplied screws.

4 - Assemble and regularly tension the retaining cables (in green)

6 - Step-by-step procedure for starting up the AMBICLEAN air cleaner

For complete and easy starting up, here is the order in which the different key phases must be carried out:

- Electrical connection of the power supply to the 400 V three phase system
- Pneumatic connection of the oil separator pressure reducer.
- Connection of the remote control with the HMI screen.
- Electrical connection with the cutting machine
- HMI screen setup and configuration.

7 - Connection to the electrical system

- 400V - three phase, no neutral - 50 Hz power supply

All the operations relating to the installation, such as those for assembly, putting into service and maintenance, are to be carried out by qualified personnel under the control of a responsible technician.

The **AMBICLEAN** air cleaner must **NECESSARILY** be isolated from all utility supplies while it is being connected.
The disconnection and padlocking of all energy sources is **mandatory**.

Recommendation

Electrical cable part number (kW)	System voltage, 50 Hz 400 V three phase	Part numbers of electrical cables
	Cable section (mm²)	Part number
4	4 x 2.5 mm²	W000010100
5.5	4 x 2.5 mm²	W000010100
7.5	4 x 4 mm²	W000010101
9	4 x 4 mm²	W000010101
11	4 x 6 mm²	W000010102
15	4 x 6 mm²	W000010102
18.5	4 x 10 mm²	W000010103
22	4 x 10 mm²	W000010103
30	4 x 16 mm²	W000010104
37	4 x 25 mm²	W000010105
55	4 x 35 mm²	W000010106

7.1 Electricity supply

The power supply is to be connected to the terminals of the main disconnector on the side panel of the **AMBICLEAN** air cleaner.
Use a multi-conductor cable and connect the three phases to the three terminals of the disconnector and the earth to the earth bar provided.
The cables must necessarily be protected on the floor, by placing cable channels or ducts

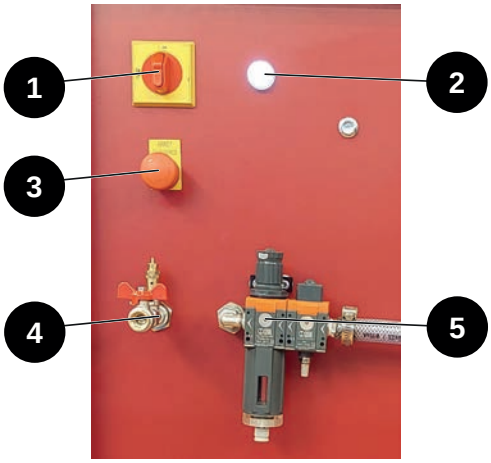
In order to avoid the loss of communication, **the power cable must be separated from the RJ45 control cable** of the HMI screen and the control cable from the cutting machine in the various cable channels.

7.2 Pneumatic connections

The customer must supply a disconnecting valve on the air supply.

The compressed air must be dry, free from impurities or humidity.
For all other information, please contact the technical staff of **LINCOLN ELECRIC**.

1	Main disconnector
2	Power on indicator
3	Emergency stop
4	Compressed air purge
5	Pressure reducer filter



- Compressed air supply 4.5 Bars
- Compressed air connection: Coupling with inner diameter 1/2” – Diameter 16mm.
- Compressed air consumption: 22-litre tank with air at atmospheric pressure for consumption of 6/7 litres per pulse depending on the adjusted operating pressure.

The supply pipe must be protected by putting in place cable channels or ducts.

7.3 Connecting the stack light

The stack light has three lights:

- White: Filter live
- Green: Filter operating
- Red: Variable frequency drive fault

7.4 Starting up the AMBICLEAN air cleaner

First of all, make sure that all the panels of the extraction unit are shut and locked

Set the main disconnector (located on the side panel) to position 1.
The white power indicator will go on.
The **AMBICLEAN** air cleaner is now being supplied with power

Press the button on the HMI screen, and the fan will start.

Press the button on the HMI screen once again, and the fan will stop.

Check the motor rotation direction.
In order to ensure the right extraction rates and motor consumption, the motor must operate in the same direction as the arrow on its ventilation casing.
If that is not so, invert two of the three supply phases wired between the variable drive and the motor.

Emergency stop:
If there is any safety problem or if an electrical fault is found. The whole installation can be switched off by pressing the emergency stop button. After identifying and solving the problem, reset the emergency stop and follow the procedure given above for starting up.

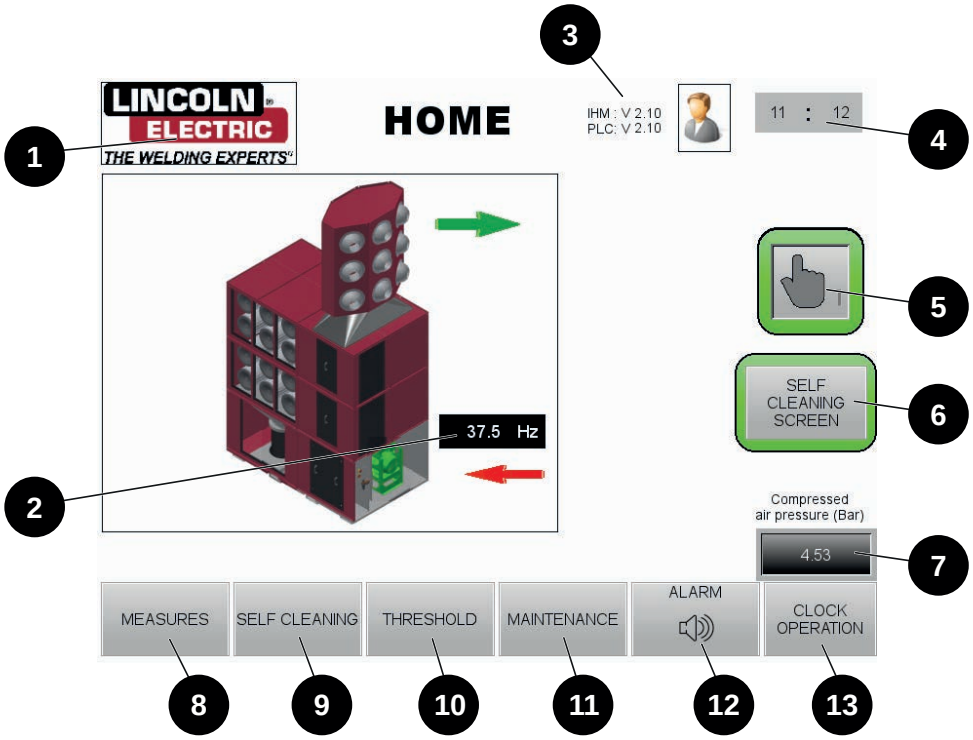
Remote control in automatic mode:
Two operating modes are possible:

- Remote control using an external contact.
- Remote control with pushbutton (self holding)

Refer to the electrical diagram of the extraction system and the machine for the wiring.

1 - Configuration of the HMI screen

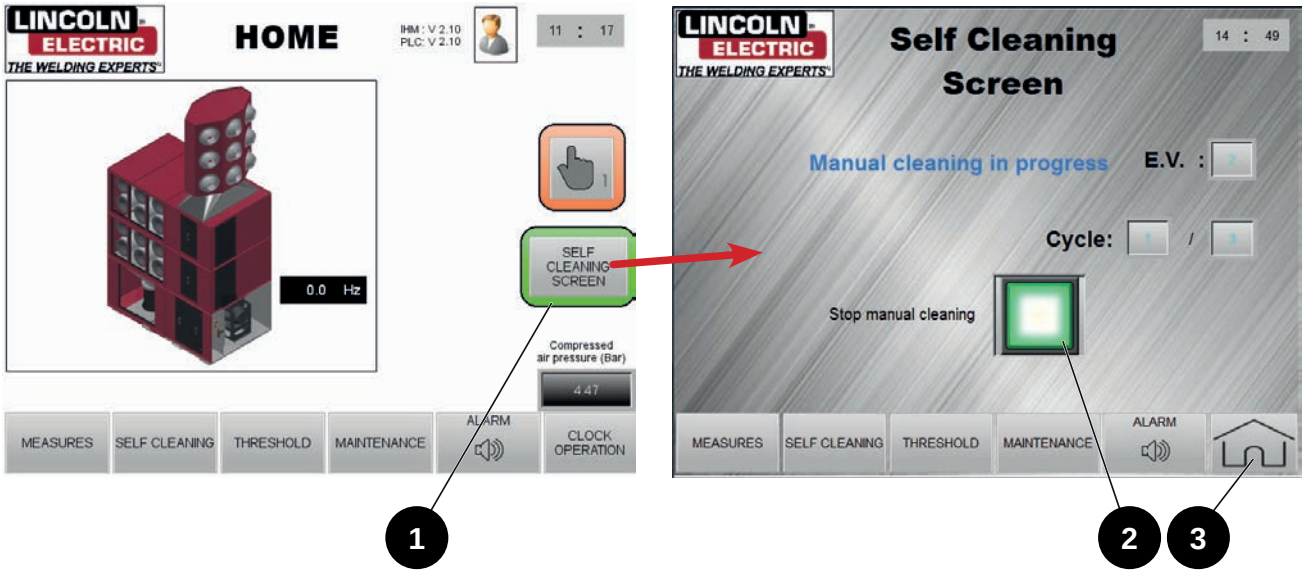
1.1 Home screen



1	Access to configuration settings
2	Operating frequency
3	Program versions for the HMI and PLC
4	Date and time setting
5	Operating mode: • Manual • Weekly clock • Automatic
6	Access to the Unclogging screen (circled in green if active)
7	Compressed air pressure
8	Access to the Measurements screen
9	Access to the Unclogging adjustment screen
10	Access to the Threshold adjustment screen
11	Access to the Maintenance adjustment screen
12	Access to the Alarms screen
13	Access to the Clocks screen

1.2 Unclogging display screen

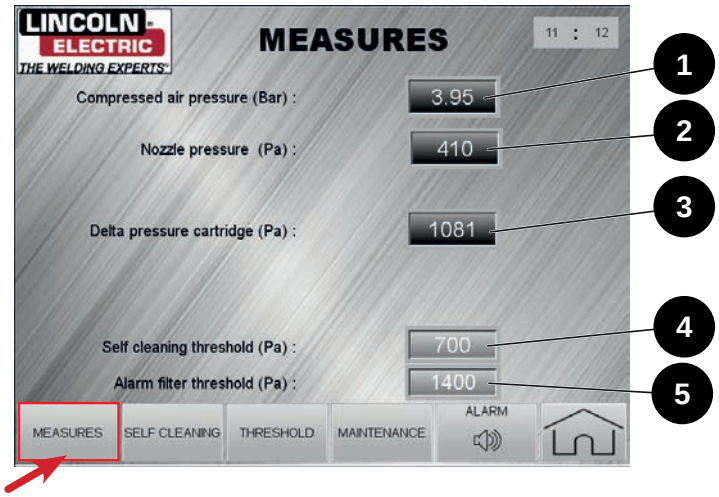
Press the Unclogging screen key of the HMI home screen to display this screen.



1	Access to the Unclogging screen
2	Start of a manual unclogging cycle
3	Back to the home screen

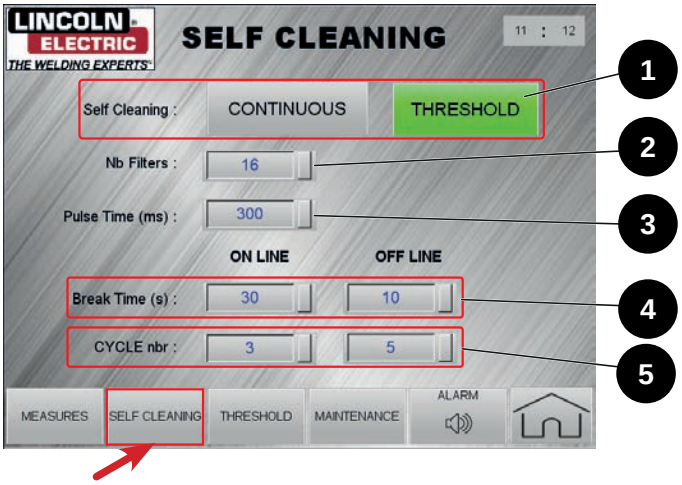
1.3 Real-time measurements screen, with or without flow variation

Real-time display of the different measurement data or regulations of the extraction unit.



1	Compressed air pressure (in Bar)
2	Ventilation nozzle pressure (probe C1 in Pascal)
3	Filter cartridge fouling level (probe C2 in Pascal)
4	Unclogging threshold (in Pascal)
5	Filter alarm threshold (in Pascal)

1.4 Unclogging adjustment screen

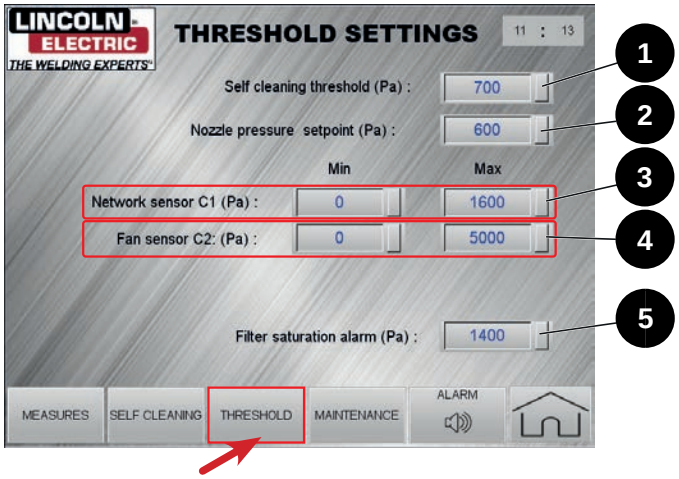


1	Choice of type of unclogging: • Permanent • Threshold
2	Number of filters
3	Pulse time (in milliseconds)
4	Pause time (in seconds)
5	Number of cycles

Factory values:

- Pulse time = 300 ms
- Online pause time = 30 s
- Offline pause time = 20 s
- Number of online cycles = 3
- Number of offline cycles = 5

1.5 Threshold adjustment screen



1	Unclogging threshold (in Pascal)
2	System pressure setpoint (in Pascal) *****
3	Ventilation nozzle pressure sensor (probe C1 in Pascal)
4	Filter cartridge fouling level sensor (probe C2 in Pascal)
5	Filter cartridges saturation alarm (in Pascal)

Factory values:

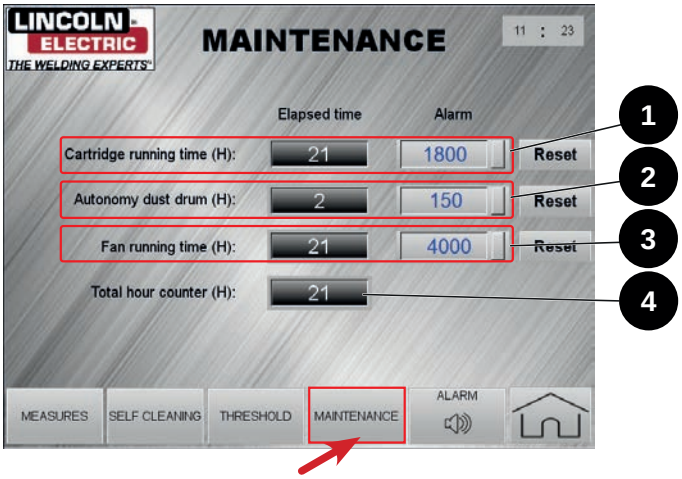
- Unclogging threshold = 700 Pa
- System pressure setpoint = to adapt for the required flow rate
- Ventilation nozzle pressure sensor C1 = 0/1600 Pa
- Cartridge fouling vacuum sensor C2 = 0/5000 Pa
- Filter saturation alarm = 1400 Pa

NB: The pressure sensors located in the electrical cabinet must be calibrated according to the values displayed on the HMI

*** System pressure setpoint/flow rate (m3/h) correspondence table**

Nozzle pressure setpoint	**AMBICLEAN 8000**	**AMBICLEAN 12000**	**AMBICLEAN 16000**
200 Pa	4000 m³/h	6000 m³/h	8000 m³/h
400 Pa	6000 m³/h	9000 m³/h	12000 m³/h
600 Pa	8000 m³/h	12000 m³/h	16000 m³/h

1.6 Maintenance adjustment screen



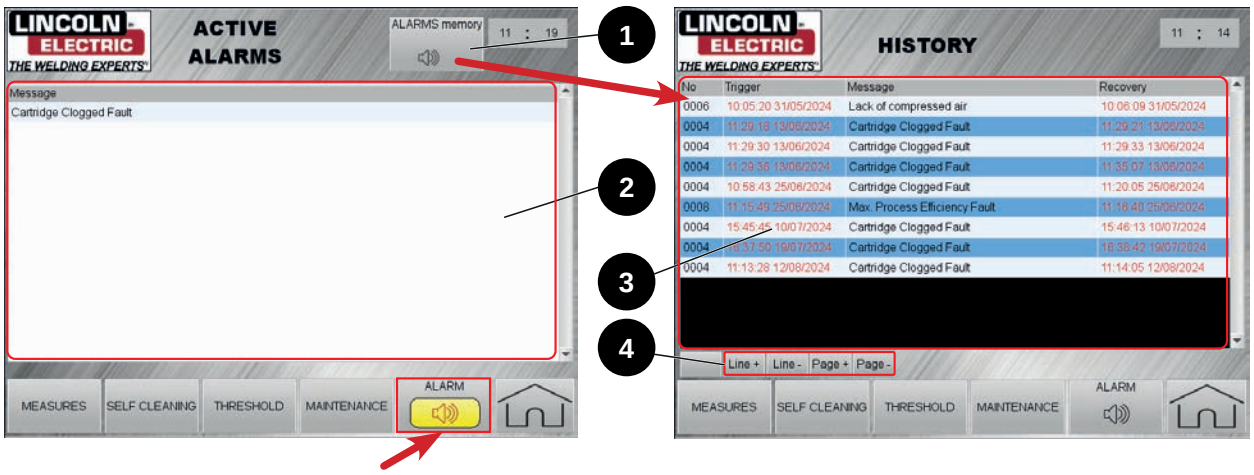
1	Cartridge usage time (in hours)
2	Container usage time (in hours)
3	Fan operating time (in hours)
4	Total unit run time counter (in hours)

Factory values:

- Use of filter cartridges = 1800 hours
- Use of the dust container = 150 hours
- Fan runtime = 4000 h

Once maintenance is completed, the customer must log in with the following:
Login: LINCOLN and password: MAINT
in order to be able to reset the time counters (RAZ key).

1.7 Alarms screen



1	Access to alarms history
2	List of active alarms
3	Alarms history
4	Page navigation button

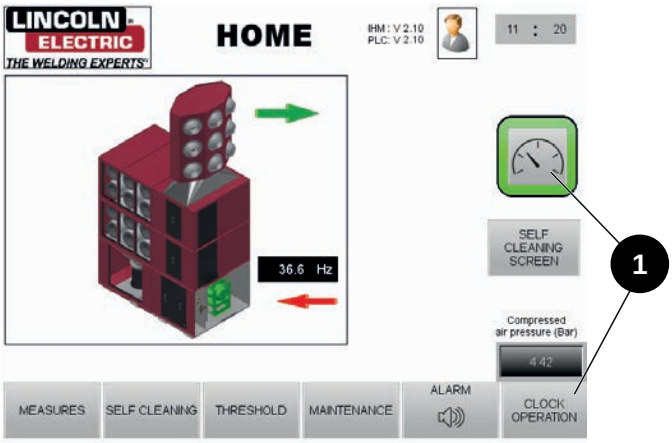
In the Alarms page, you will only find alarms that are active in real time.
Once the alarms have been acknowledged, they are logged on the Alarms history page.

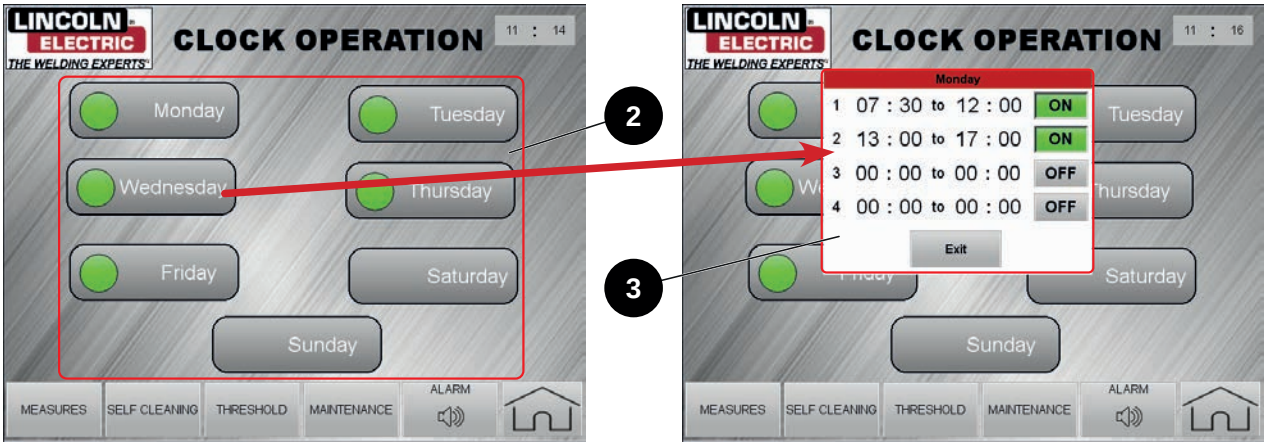
1.8 Clocks screen

The Clock page is accessible from the Home page or by clicking the Clock mode if it is activated

The days are active when the time slots are completed and activated

Four time slots are available every day; activation or not by selecting On/Off

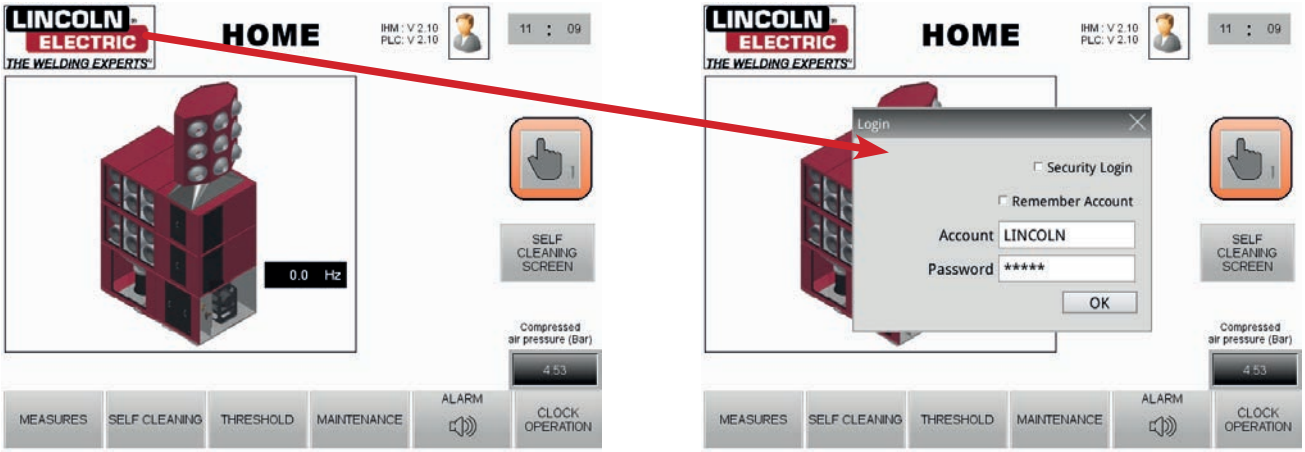




1	Access to the Clock page
2	Day of the week
3	Time slot settings zone

NB:
The time slots saved are only operational if the Clock mode has been selected in the Mode configuration page.

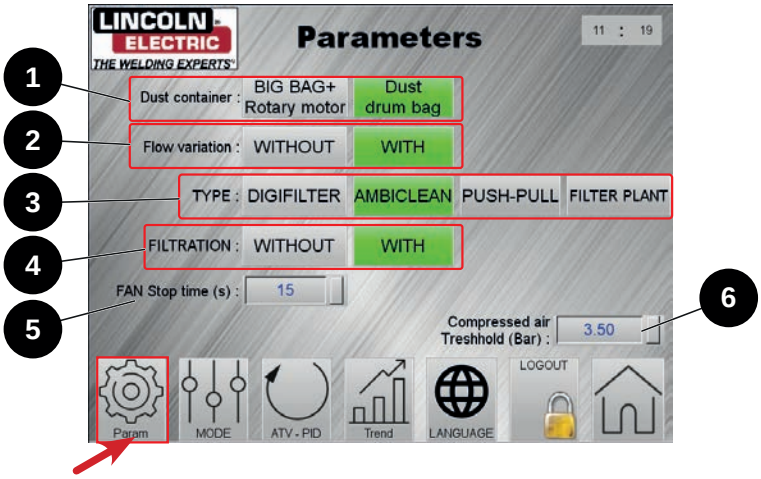
1.9 System screen



Press the LINCOLN ELECRIC logo.
After entering the codes, press OK.

- Login: LINCOLN
- Password: MAINT

1.10 Settings screen



1	Dust recovery mode (dust container)
2	Speed variation setting (with)
3	Type of cleaning unit (**AMBICLEAN**)
4	Dust filtration (with)
5	Fan stopping delay (in seconds/active only in automatic mode)
6	Compressed air alarm minimum threshold (in bars)

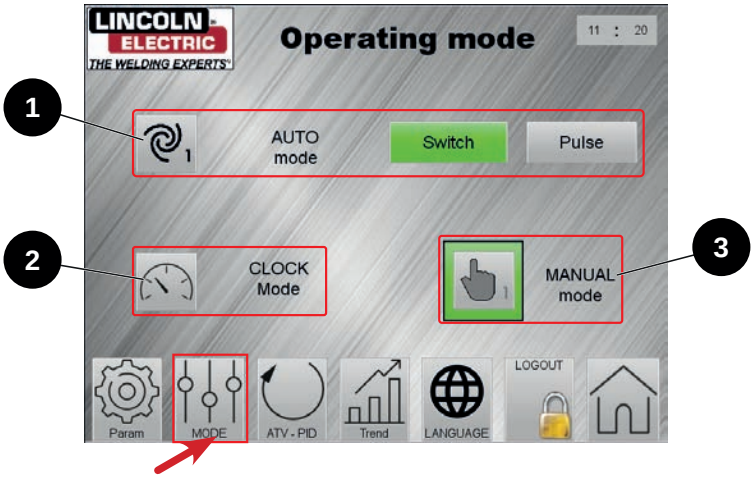
Permitted modifications:

- Fan stopping time
- Compressed air alarm threshold

Factory values:

- Fan stopping time = 30 s
- Compressed air threshold = 3.5 bar

1.11 Operating mode screen

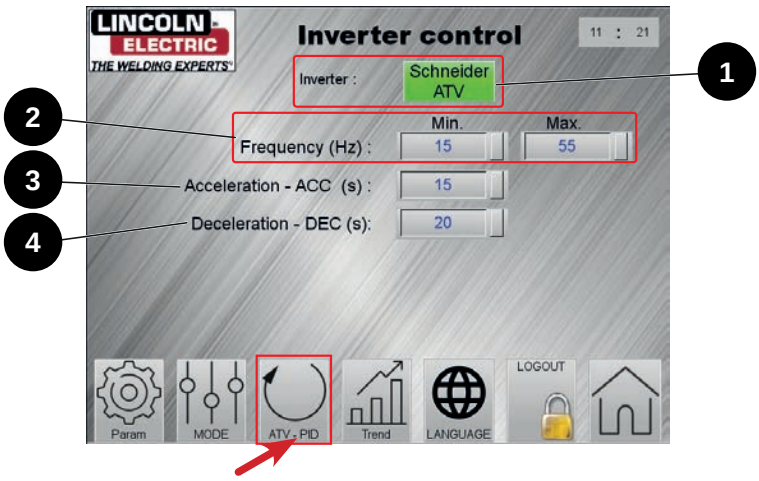


1	Automatic mode by external contact of the hold-to-run type or pulse type
2	Automatic mode by time slot
3	Manual mode

Press the logo to select the desired mode.

NB: The fan must be halted for the modes to become selectable.

1.12 Variable drive control screen

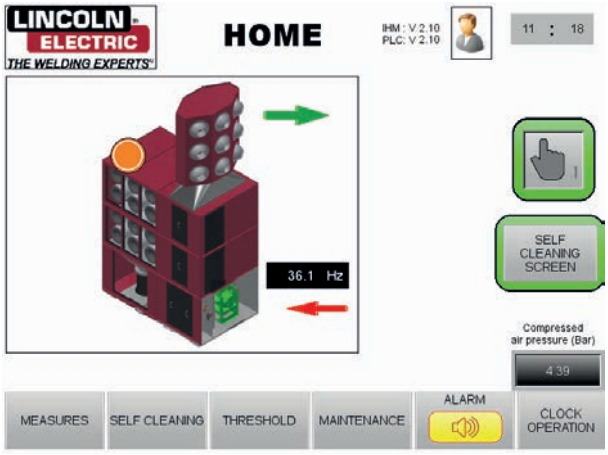


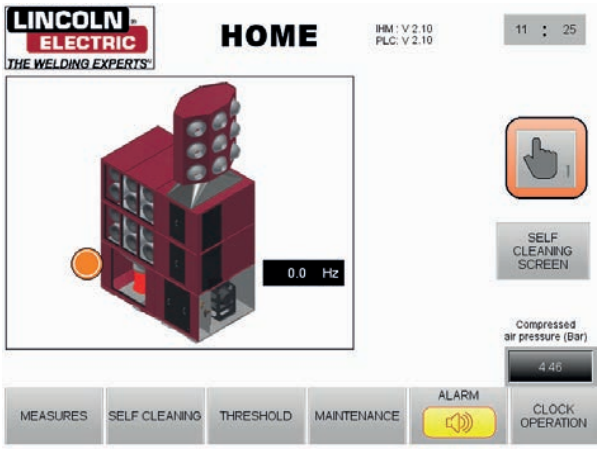
1	Type of variable drive
2	Setting of the min and max variable drive frequencies (in Hertz) • Min. frequency = 15 Hz • Max. frequency = 55 Hz
3	Acceleration time setting (in seconds)
4	Deceleration time setting (in seconds)

1.13 Languages screen

Choice of language depending on the country.

1.14 Maintenance alarms screen

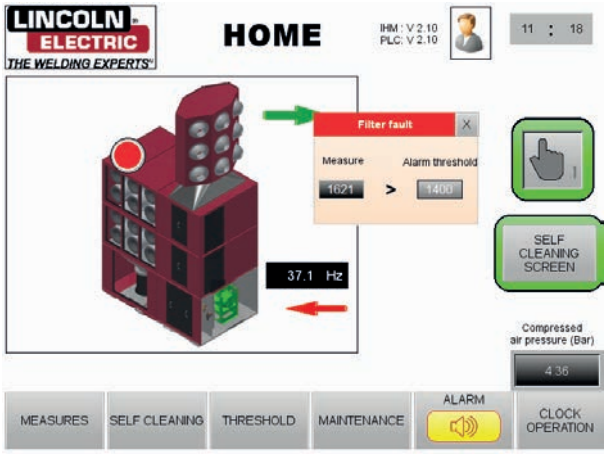




Display by **an orange dot** of the overrun of maintenance times:

- Filters operation
- Use of container
- Fan operation

1.15 Fault alarms screen



Display by **a red dot** of the alarm values:

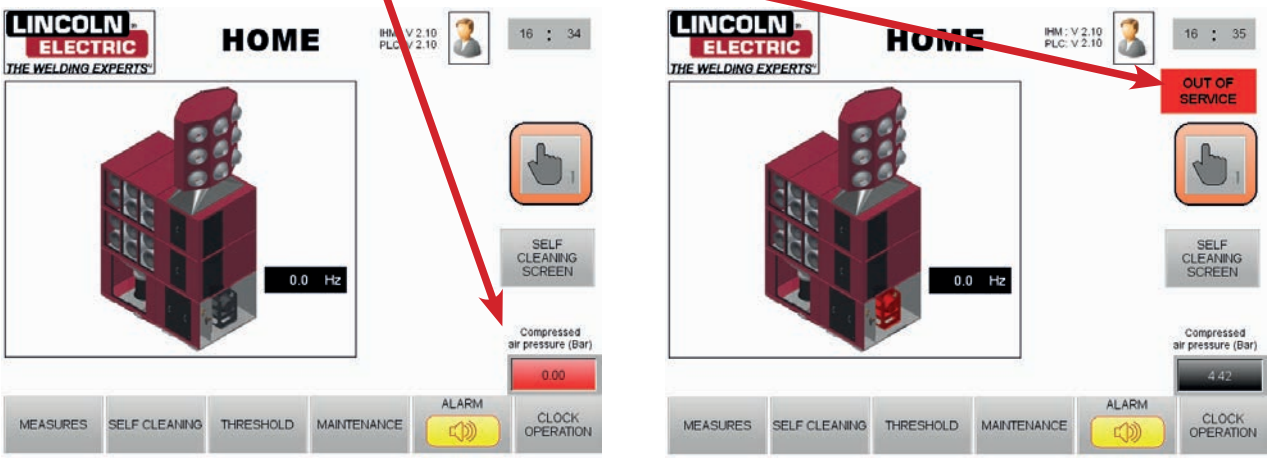
- Filter cartridge saturation

1.14 Out-of-service screen

The **AMBICLEAN** air cleaner unit is out of service.

Possible causes:

- Emergency stop applied
- Compressed air threshold insufficient
- Variable drive fault



For more details, access the Alarms page

When the **AMBICLEAN** air cleaner is out of service, the extraction system cannot be restarted.

- Check the emergency stops.
- Check the compressed air pressure.
- Read the error message displayed on the screen of the variable drive in the electrical cabinet of the unit.

1 - Care

Please read the manually carefully before you start any servicing work. Maintenance operations may only be carried out by specialised and qualified individuals. Behaviour that does not comply with the safety instructions provided could lead to major hazards for personnel and damage to property and/or the surroundings.

Before working on the machine, it is ***MANDATORY*** to lock out all the supplies of utilities to the machine (electricity, air, gas etc.). The air circuit must be vented before any work is done on it Locking an emergency stop button is not sufficient.

CAUTION: All work at heights (maintenance, troubleshooting etc.) must be carried out with appropriate personnel lifting equipment.

For operating instructions, adjustments, troubleshooting and spare parts, please refer to the special instructions for safe operating and maintenance.

Before starting up the machine, make sure that the replaced parts are perfectly installed and that the tools used are removed from the machine.
Make sure that each safety device is in good condition and legible.

MAINTENANCE OF MECHANICAL PARTS

The machine requires negligible mechanical maintenance if it is used correctly in accordance with its technical characteristics.
Before any type of maintenance that is not clearly defined in these instructions, please make inquiries with the technical department of **LINCOLN ELECRIC**.
The performance of operations that may not be carried out or are contrary to the standards and procedures described in the manual would release **LINCOLN ELECRIC** from liability for any damage caused and would void the guarantee if it is still valid.

1.1 Pneumatic maintenance

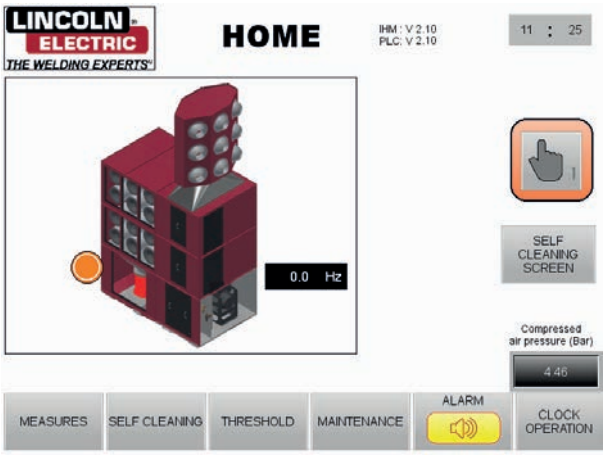
The filter must be purged regularly.
The air supply pipes must be inspected (for leaks) and changed if necessary.
Refer to the maintenance counter or cartridge change counter, which is 1800 hours.

1.2 Electrical maintenance

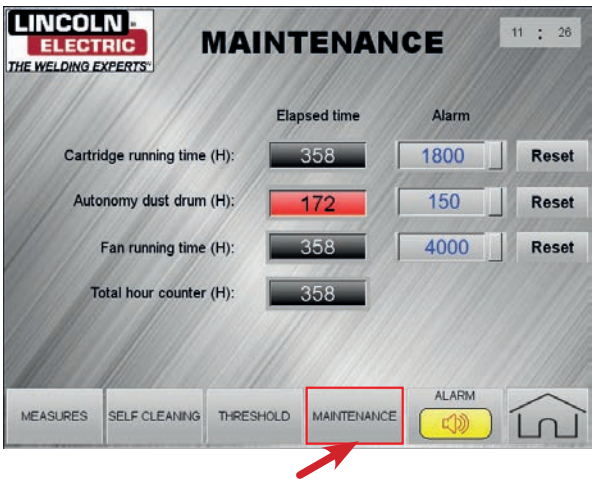
Regularly check the cables and connections. Tighten the screw connections.
Worn cables must be replaced.
Refer to the maintenance counter of the unit, which is 4000 hours.

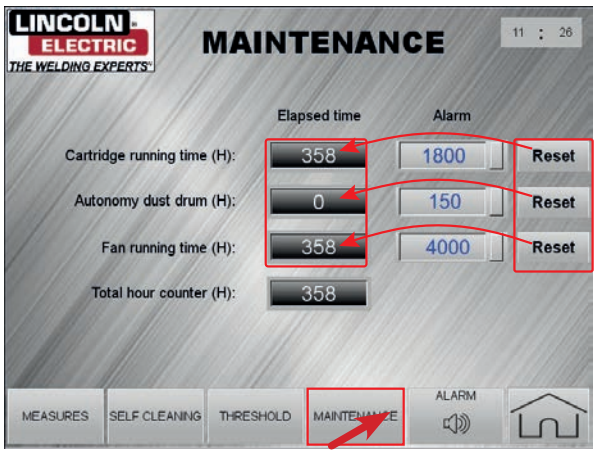
1.3 Maintenance message on the HMI screen

The display of **an orange indicator** on filter cartridges or dust containers does not indicate faults.
They are maintenance alarms.
They may relate to the replacement of filter cartridges, the emptying of dust containers, motor maintenance or general unit maintenance.



These maintenance alarms indicate that the run time counter of the relevant part has reached the limit and maintenance is required; the counter must then be reset up to the next cycle.





To reset the counter, you must click on the counter and then log in:

- Login: LINCOLN
- Password: MAINT

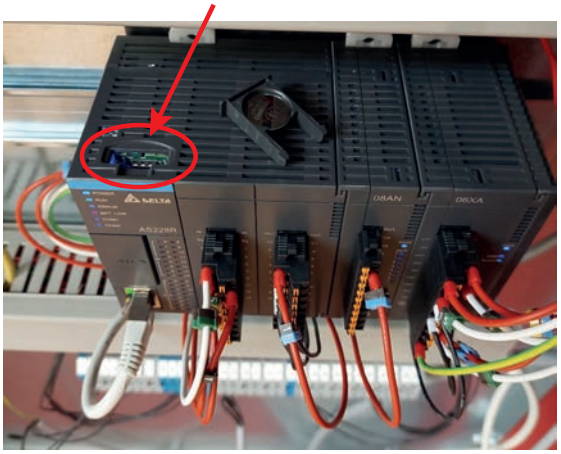
1.4 Batteries on the PLC and HMI screen

The Delta HMI and PLC are fitted with batteries to save the configurations and settings.

The life of those batteries is estimated to be between 2 and 3 years, if the unit is regularly powered on and up to 5 years if the unit remains powered.

That is why we recommend leaving the unit on standby and powered at the end of the day.

on the Delta PLC: CR1620 - 3V battery



on the Delta HMI screen: CR2032 - 3V battery

In order to not lose the settings, the battery change must be made with the power on, by a worker with electrical approval.

1.5 HMI screen and PLC software update

For different reasons relating to maintenance, product upgrade or failure, the programs of the PLC and HMI screen can be updated.

Please contact the staff of LINCOLN ELECRIC for these tasks.

1.6 Fan

The rotating parts of fans (wheel, shaft, pulley) are very hazardous.

Check fan vibrations upon starting up. They must comply with ISO 14694 according to the tables below.
If they are not conforming, please contact us.
This regular inspection is required for the integrity of the fan.

Table 1 - Fan application category

Application	Power limits kW	Categories of application of fan
Households	≤ 0.15	BV-1
	> 0.15	BV-2
HVAC and farming	≤ 0.37	BV-2
	> 0.37	BV-3
Industrial processes and energy generation	≤ 300	BV-3
	> 300	See ISO 10816-3
Transport and maritime	≤ 15	BV-3
	> 15	BV-4
Traffic/tunnel	≤ 75	BV-3
	> 75	BV-4
Petrochemicals processes	≤ 37	BV-3
	> 37	BV-4
Computer chip manufacturing	None	BV-5

Table 2 - Vibration limits

Status	Category of application	Rigid assembly mm/s (rms).	Flexible assembly mm/s (rms).
Starting	BV-1	10	11.2
	BV-2	5.6	9
	BV-3	4.5	6.3
	BV-4	2.8	4.5
	BV-5	1.8	2.8
Alarm	BV-1	10.6	14
	BV-2	9	14
	BV-3	7.1	11.8
	BV-4	4.5	7.1
	BV-5	4	5.6
Stopping	BV-1	Depending on history	Depending on history
	BV-2	Depending on history	Depending on history
	BV-3	9	12.5
	BV-4	7.1	11.2
	BV-5	5.6	7.1

NB: **LINCOLN ELECRIC** markets fans of categories BV3 and BV4.

All maintenance operations are to be carried out with the power to the system switched off.
The user may not modify the construction of the fan in any way.

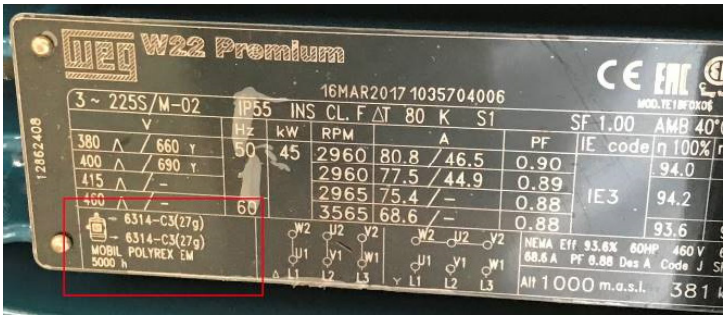
Check that dust is not being deposited in large quantities on the following:
- The motor ventilation blades.
- The fixed and rotating parts of the fan.

Clean if necessary.

The fan wheel must be clean and regularly cleaned in order to avoid a drop in efficiency or wheel unbalance.

Lubrication:
If the fan does not have a lubricator, no lubrication is required.

If the fan does have a lubricator, follow the instructions provided on the motor identification plate.



Motors with lubricators must be halted before lubrication. Proceed as follows:
- Before lubrication, clean the lubricator plug and the immediate vicinity carefully.
- Remove the lubricant entry protection.
- Pump approximately half the total lubricant indicated on the identification plate of the motor and make the motor run for one minute at nominal speed.
- Stop the motor and pump the remaining lubricant.
- Plug the lubricant inlet and put back the plug that shuts off lubricant removal.

Excess lubrication can lead to bearing overheating, which can make the bearing fail.
Type of lubricant to use: Mobil Polyrex EM

Rear lubricator

Front lubricator

Bearing maintenance:

Bearing inspection

As soon as the motor shows the following:

- noise or abnormal vibrations,
- abnormal heating of the bearing when it is lubricated correctly; the condition of the bearings must be inspected.

Damaged bearings must be replaced as soon as possible to prevent more significant damage to the motor and driven parts.
When a bearing needs to be replaced, **the other bearing must also be replaced.**
Seals must always be changed when bearings are changed.
The floating bearing must allow the expansion of the rotor shaft (make sure to identify it during disassembly).

Bearing housing overhaul

Housings with bearings with no lubricator
Disassemble the motor; remove the old lubricant and clean the bearings and accessories with grease remover.
Put fresh lubricant: the filling rate of the housing with fresh lubricant is 50% of the free space.

Housings with bearings with lubricator
Always start off by cleaning the waste grease channel
If using the type of grease identified on the nameplate, remove the covers and clean the lubricator heads.
If a different grease from that on the nameplate is being used, the motor must be dismantled and the bearings and accessories cleaned with degreasing agent (carefully clean the grease inlet and outlet pipes) to remove the old grease before relubrication.
For proper lubrication, fill the inner free spaces of bearing retainers, flanges and grease pipes and 30% of the bearing free space.
Then rotate the motor shaft to spread the grease.

Important:
Too much grease causes the bearing to overheat (statistics show that more bearings are damaged through too much grease than too little grease).

Important note:
Fresh grease must be recently manufactured, of equivalent performance and free from any impurity (dust, water, etc.).

1.7 Maintenance of filtering elements

Pre-filters:

The pre-filter must be cleaned with the extraction system disconnected and locked out.

We recommend weekly cleaning at the start; depending on use and fouling, a monthly cleaning frequency may subsequently be envisaged.

Periodically, as a preventive measure, or whenever the extraction does not seem adequate:

Clean with dry compressed air in a well-ventilated area or immerse in a solution made of water and Filter clean 20L,
part no W000342878, and air dry (dilution depending on fouling, see label on the drum).

Access to the pre-filters is from the panel on the front.

Maintenance/replacement of filter cartridges:

To replace the filter cartridges, always use gloves, safety glasses, a respiratory mask and appropriate clothing in order to prevent any risk of contact with or inhalation of the particles collected. The power supply must always be switched off using the disconnector or via the fuses. If the filter has a power connector, it must be separated from its socket on the wall.

We recommend inspecting the surfaces of the cartridges after every 3 months:

- If the dust build-up is excessive, the working of the solenoid valves and the application of offline unclogging cycles must be inspected.
- If there are oily deposits, the filter cartridges must be changed.

Every year, or after 1800 hours of use as indicated by the corresponding maintenance counter, change the filter cartridges.

1: Open the filter compartment
2: Unscrew the flat nut that holds the cartridge fastened
3: Place a plastic bag around the cartridge and remove it
4: Put the clogged cartridge in the packaging of the new cartridge
5: Put in the new cartridge, screw back the flat nut and close the doors
6: Apply the starting up procedure

Users are strongly advised to replace the cartridge as soon as the system ceases to operate satisfactorily. (When extraction no longer seems adequate). Or when the cartridge saturation alarm is active.

Used filters must be treated using an appropriate process in accordance with local regulations.

Procedure for emptying the dust container:

While emptying the container/s, use gloves, protective glasses, a respiratory mask and appropriate clothing in order to avoid any risk of contact with or inhalation of the particles collected. The power supply must always be switched off using the disconnector or via the fuses.

By default, there is no bag. If there is one, it must be weighted down so that it is not sucked up by the vacuum when it is empty.

1: The containers must be emptied regularly
2: Switch off the power supply to the fan.
3: Open the dust container compartment
4: Take off the holding latches (to do so, press the unlocking mechanisms of the latches on the HD units)
5: Remote the container using equipment appropriate for the weight of the assembly.
6: If there is a bag, replace the bag inside and put the container in its place.
7: Put the unit back into service.

Dust bags must be treated using an appropriate process in accordance with local regulations

Inspection of unclogging components:

It is important to inspect the proper working and position of the unclogging solenoid valves while replacing filter cartridges. They must be placed along the centre line of the cartridges.

Ordering procedure:

Almost all the parts of a machine or installation are referenced in the photographs and sketches.

The descriptive tables contain three types of item:

- items normally held in stock: ✔
- items not held in stock: ✘
- articles upon request: no reference

(For such parts, please complete the list of parts page and send us a copy. In the Order column, state the number of parts required and indicate the type and number of your equipment.)

For items referenced in the photographs or sketches but not included in the tables, please send us a copy of the relevant page and highlight the relevant reference.

Example:

✔	normally held in stock.
✘	not in stock
	upon request.
