THE HARRIS DIFFERENCE

What you should know about Harris products vs. the competition

- ▶ **Premium, Industrial Grade Products** - All Harris regulators are industrial grade and designed for professional use.
- ▶ **Made in the USA** - Harris regulators are made in Gainesville, Georgia, USA.
- ▶ **3-Year Warranty**- Virtually all Harris regulators come with a three-year warranty.
- ▶ **Innovative Design** - Harris regulators are designed to have fewer internal components which translates to fewer failures. Competitive models typically have six to ten more parts.
- ▶ **Encapsulated Seat** - From the most economical model to the most expensive, all Harris regulators are equipped with an encapsulated seat. Most regulators fail due to seat contamination. Harris models include a 10 micron filter to keep particulate materials from contaminating the valve seat. Competitors only offer encapsulated seats on their most expensive models.
- ▶ **PTFE Teflon Seat Material** - Teflon material is inert to virtually all gases and in addition can be polished to resist friction and erosion. This means that Harris regulators have a reduced chance of premature product failure, offer a longer service life and are inherently safer compared to competitive regulators.
- ▶ **Internal Relief Valve** - Harris regulators are equipped with an internal relief valve that prevents tampering with the regulator which could result in a serious accident. The competition has an external relief valve that can be tampered with and requires an additional connection-another potential for leaks.
- ▶ **Commonality and Interchangeability of Parts** - The innovative design of Harris regulators features commonality and interchangeability of parts. This allows better pricing, availability of repair parts, and makes designing new regulators much easier.
